VIRGINIA GOVERNMENT WELL RECORDS SEARCHED

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

Virginia Public Water Supplies
Source: Department of Health, Office of Water Programs
Telephone: 804-786-1756

Virginia Oil and Gas Wells
Source: Department of Mines, Minerals and Energy
Telephone: 804-692-3200
A listing of oil and gas well locations.

APPENDIX F

Compiled Research Log

Document Location	Document Date	Document Name	Author	Description of Information
Admin Records: 01gilrein	NA	Presentation by USEPA - Mr. Stephen Gilrein	U.S. Environmental Protection Agency	No relevance to PFAS
Admin Records: 02newsome	11/7/2001	Army Environmental Restoration Update	Office of the Deputy Assistant Secretary of the Army	No relevance to PFAS
Admin Records: 03wilson	2001	Meeting Program Goals: DERP ER,A/FUDS Workshop 2001	Office of the Director of Environmental Programs Restoration	No relevance to PFAS
Admin Records: 04edwards	11/6/2001	DERP Workshop	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: 05brown	11/1/2001	Cost-to-Complete	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: 06ferries	11/1/2001	Overview of RACER	Talisman Partners an Earth Tech Company	No relevance to PFAS
Admin Records: 07dutcher	11/8/2001	Defense Site Environmental Restoration Tracking System	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: 08young	11/1/2001	Environmental Program, Communications, and Reporting	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: 09ganta	7/1/2001	Environmental Programs	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: 10simmons	11/7/2001	DERP Workshop- Environmental Restoration Program	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: 11simmons	none	Environmental Restoration Management Action Plan	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: 12simmons	11/1/2001	Sep 2001 DERP Management Guide	U.S. Army Environmental Center	No relevance to PFAS

Document Location	Document Date	Document Name	Author	Description of Information
Admin Records: 13akers	11/8/2001	Arm's Defense Environmental Program Workshop	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: 14blandemer	none	Prioritization & Implementation: Beyond Relative Risk Site Evaluations	not listed	No relevance to PFAS
Admin Records: 15zondlo	11/7/2001	The Redstone Arsenal Approach to Karst- Defense Environmental Restoration Program Workshop	USACE	Hydrogeologic details. No relevance to PFAS
Admin Records: 16cerar	11/1/2001	Work Classification- DERP Conference	Aberdeen Proving Grounds	No relevance to PFAS
Admin Records: 17citron	11/8/2001	DERP Workshop- Land Use Control Update	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: 18meier	11/1/2001	Long Term Operations/Long Term Monitoring Contract	USACE	No relevance to PFAS
Admin Records: 19daniel	none	Restoration Technology Program	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: 20maly	none	Draft Army Natural Resource Injury Policy and Guidance- Phase 3 Range Inventory	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: 21lancer	11/8/2001	Army's DERP Workshop Transformation/Communication	USACE	No relevance to PFAS
Admin Records: 22speer	8/21/2001	Presentation to ASTSWMO Symposium- "Environmental Challenges at Federal Facilities Past, Present and Future"	The CNA Corporation	No relevance to PFAS
Admin Records: 00048	10/1/1976	Installation Assessment of Radford Army Ammunition Plant	U.S. Army Toxic and Hazardous Materials Agency	Mention of an administration building fire (pg II-21), list of pesticides/herbicides (pg II-29), mention of Drinking Water Plant (Building 419)
Admin Records: 00234	3/1/1978	Evaluation of Industrial Liquid Wasate Treatment Facilities/Processes at Radford Army Ammunition Plant	U.S. Army Armament Research and Development Command	No relevance to PFAS
Admin Records: 00278	11/1/1973	Engineering Study of Disposal Methods for Waste Acid Neutralization Sludge	Defense Documentation Agency	No relevance to PFAS
Admin Records: 00604	12/1/1984	Installation Reassessment of Radford Army Ammunition Plant (Report No. 103R)	U.S. Army Toxic and Hazardous Materials Agency	List of pesticide usage (pg 2-20)
Admin Records: 00605	10/1/1976	Installation Assessment of Radford Army Ammunition Plant (Report No. 103)	Department of the Army	List of herbicide use (pg 47)
Admin Records: 00803	10/27/1989	Air Pollution Emission Assessment No. 42-21-0704-90	U.S. Army Environmental Hygiene Agency	Mention of afterburner (No. 2 fuel oil fired unit) (pg 2)

Document Location	Document Date	Document Name	Author	Description of Information
Admin Records: 00881	9/15/1989	Receiving Stream Biological Study No. 32-24-0921-90 (Chemical, Physical, and Biological Water Quality of Receiving Streams)	U.S. Army Environmental Hygiene Agency	Includes water quality test results
Admin Records: 00957	12/16/1975	Aquatic Field Surveys at Radford, Holston, Volunteer, and Milan Army Ammunition Plants (Vol. III-Volunteer)	Environmental Control Technology Corporation	No relevance to PFAS
Admin Records: 00968/00969	11/1/1976	Aquatic Field Surveys at Radford, Holston, Volunteer, and Milan Army Ammunition Plants (Vol. I and II)	Environmental Control Technology Corporation	Aqueous phase chemical test results mentioning cadmium and chromium
Admin Records: 00973	12/11/1975	Aquatic Field Surveys at Radford, Holston, Volunteer, and Milan Army Ammunition Plants (Vol. I - Radford)	Environmental Control Technology Corporation	Includes sediment and other analyte test results
Admin Records: 00974	11/1/1976	Aquatic Field Surveys at Radford, Holston, Volunteer, and Milan Army Ammunition Plants (Vol. III-Microbiological Investigations, Iowa and Joliet Army Ammunition Plants)	Environmental Control Technology Corporation	Not related to Radford AAP
Admin Records: 01004	8/25/1989	Wastewater Management Study No. 32-24-0920-90	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 01124	4/1/1976	Pollution Status Report- Radford Army Ammunition Plant	Hercules Incorporated	Analyses of discharges includes mention of discharge from "waste propellant burning grounds" (Discharge No. 017)
Admin Records:01223	8/1/1979	Physical Chemical Pilot Plant Study for Treatment of Propellant Manufacturing Wastewaters	U.S. Army Armament Research and Development Command	No relevance to PFAS
Admin Records: 01283	8/17/1990	Air Pollution Management Consultation No. 42-21-0728-90	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 01650	6/1/1980	Physical Chemical Pilot Plant Study for Treatment of Propellant Manufacturing Wastewaters	U.S. Army Armament Research and Development Command	No relevance to PFAS
Admin Records: 01704	1/1/1986	Operation and Calibration of the Automated and Continuous Biological Monitoring Facility at the Radford Army Ammunition Plant	U.S. Army Armament Research and Development Command	Listed pesticide/herbicide levels
Admin Records: 01761	12/1/1983	Characterization and Treatment of Wastewater Treatment Sludges at Radford Army Ammunition Plant	U.S. Army Armament Research and Development Command	No relevance to PFAS
Admin Records: 2003 Radford IAP	2003	Radford AAP Installation Action Plan	Radford Army Ammunition Plant	Mention of Contaminated Waste Stage and Burn Area (SWMU 17A). Mention of "high concentrations of metals from plating operations" in SWMU 69. Mention of Western Burning Ground
Admin Records: 2005 Radford IAP (10 Oct 04)	10/10/2004	Radford AAP Installation Action Plan	Radford Army Ammunition Plant	Mention of Burning Area - 3 and Plating Shop -1. Description of Former Cadmium Plating Facility (Building 4343). Mention of Flash Burn Parts Area (SWMU 71), Waste Propellant Burning Ground (SWMU 13)

Document Location	Document Date	Document Name	Author	Description of Information
Admin Records: 02012	8/10/1989	Ambient Air Quality Consultation No. 43-21-0635-90	U.S. Army Environmental Hygiene Agency	Mention of Explosives Burning Ground No. RD-0000-H-001
Admin Records: 02112	9/1/1989	Investigation and Evaluation of Underground Storage Tanks	Department of the Army Corps of Engineers	No relevance to PFAS
Admin Records: 02535	5/19/1989	Air Pollution Emission Assessment No. 42-21-0442-89	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 02761	11/1/1990	Preliminary Assessment Responses for Radford AAP	U.S. Army Toxic and Hazardous Materials Agency	Mention of Contaminated Waste Burning Area (Air Curtain Destructor). Includes some groundwater test results
Admin Records: 02877	10/11/1990	Environmental Noise Study No. 52-34-0619-91	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 02951	4/12/1991	Memo: Results of Synthetic Organic Chemicals Survey for Radford AAP	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 02968	6/1/1990	Ambient Air Quality Consultation No. 43-21-0604-91	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 03105	5/1/1991	Final Report: Ambient Air Quality Consultation No. 43-21-0170-91	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 03136	4/6/1990	Radford AAP Spill Prevention Control and Countermeasure Plan and Installation Spill Contingency Plan		No relevance to PFAS
Admin Records: 03267	8/2/1990	Receiving Water Biological Study No. 32-24-0066-91- Assessment of Water Quality Impacts from Wastewater Discharges	U.S. Army Environmental Hygiene Agency	Includes surface water lab results
Admin Records: 03935	3/1/1991	Removal of DNT from Wastewaters at Radford AAP	U.S. Army Toxic and Hazardous Materials Agency	Mention and description of DNT coating activities
Admin Records: 04181	3/1/1992	Preliminary Assessment Report Addendum for Radford AAP	U.S. Army Toxic and Hazardous Materials Agency	Mention of Disposal Area for Ash From Burning Propellants-- SWMU 54
Admin Records: 04563	3/4/1993	Pest Management Survey, No. 16-61-AW78-93	U.S. Army Environmental Hygiene Agency	Description of pesticide storage building (Bldg 7219)
Admin Records: 04958	10/1/1976	Biological Pilot Plant Study at Radford AAP	U.S. Army Natick Research and Development Command	No relevance to PFAS
Admin Records: 05001	7/1/2004	SWMU 54 Additional Characterization: Work Instructions	URS	Includes sampling and analysis results
Admin Records: 05002	8/1/2003	Final Master Work Plan	URS	No relevance to PFAS
Admin Records: 05003	9/1/2002	Work Plan Addendum 009: SWMU 31 and Horseshoe Area Groundwater Study	IT Corporation	Includes field sampling results
Admin Records: 05004	9/1/2000	Master Work Plan, Quality Assurance Plan, Health and Safety Plan- Addendum 010: Facility-Wide Background Study	URS	No relevance to PFAS

Document Location	Document Date	Document Name	Author	Description of Information
Admin Records: 05005	11/1/2000	Master Work Plan, Quality Assurance Plan, Health and Safety Plan- Addendum No. 11 (Soil Sampling and Reporting at SWMU 6)	URS	No relevance to PFAS
Admin Records: 05006	9/1/2002	Work Plan Addendum 012: Site Characterization Plan for SWMU 39, SWMU 48, SWMU 49, SWMU 50, SWMU 58, SWMU 59, AOC-FLFA, AOC-Building 4343, New River Unit	IT Corporation	Mention of "Northern Burning Ground" and "Western Burning Ground"
Admin Records: 05007	9/1/2002	Work Plan Addendum No. 13- RCRA Facility Investigation at SWMU 54	URS	Includes soil anayltical results
Admin Records: 05008_1	12/1/2003	SWMU 58 RCRA Facility Investigation Report	Shaw Environmental, Inc.	Includes soil anayltical results
Admin Records: 05008_2	4/1/2003	correspondance with USEPA	Alliant Techsystems	No relevance to PFAS
Admin Records: 05008_3	8/5/2003	correspondance with USEPA	Alliant Techsystems	No relevance to PFAS
Admin Records: 05008_4	11/5/2003	correspondance with USEPA	Alliant Techsystems	No relevance to PFAS
Admin Records: 05008_5	3/1/2003	Response to USEPA Comments dated 18 September 2003	Alliant Techsystems	No relevance to PFAS
Admin Records: 05008_6	7/12/2004	correspondance with USEPA	Alliant Techsystems	No relevance to PFAS
Admin Records: 05008_7	12/17/2004	correspondance with USEPA	Alliant Techsystems	No relevance to PFAS
Admin Records: 05009	1/1/2004	Soil Screening Report, SWMUs 8 and 36	URS	Includes soil/sludge chemical data
Admin Records: 05010	5/1/2001	SWMU 6 Sampling Results Report	URS Dames & Moore	Includes pesticide/herbicide analytical results
Admin Records: 05011	6/1/2005	SWMU 39 RCRA Facility Investigation/Corrective Measures Study Report	Shaw Environmental, Inc.	No relevance to PFAS
Admin Records: 05012	2/1/2004	Building 4343 RCRA Facility Investigation/Corrective Measures Study Report	Shaw Environmental, Inc.	Description of Former Cadmium Plating Facility
Admin Records: 05014	9/28/2000	correspondance with USEPA	USEPA	No relevance to PFAS
Admin Records: 05015	10/1/2002	SWMU 6 Decision Document	URS	No relevance to PFAS
Admin Records: 05016	6/1/2005	Integrated Natural Resources Management Plan	Radford Army Ammunition Plant	No relevance to PFAS
Admin Records: 05017	9/1/1996	Supplemental Work Plan Dye Tracing Study- Horseshoe Area	Parsons Engineering Science, Inc.	No relevance to PFAS
Admin Records: 05018	5/1/2004	NRU Additional Characterization Sampling: Work Instructions	Shaw Environmental, Inc.	No relevance to PFAS
Admin Records: 05019	11/12/2002	Final U.S. Army Close, Transferring, and Transferred Range/Site Inventory	Malcolm Pirnie, Inc.	No relevance to PFAS
Admin Records: 05020	12/1/2003	Work Plan Addendum No. 18- RCRA Facility Investigation at SWMU 41	URS	No relevance to PFAS
Admin Records: 05021	2/1/2004	Work Plan Addendum No. 17- SWMU 51 RCRA Facility Investigation	Shaw Environmental, Inc.	Includes pesticide/herbicide analytical results
Admin Records: 05022	8/1/2003	Work Plan Addendum No. 16- Site Screening Process for SWMU's 13, 37, 38, 46, 57, 68, 69, 75, 76, and Areas of Concern A, F, Q	URS	Includes soil test results
Admin Records: 05023	3/1/2003	Work Plan Addendum No. 15- Soil Sampling Investigation for SWMUs 8 and 36	URS	No relevance to PFAS

Document Location	Document Date	Document Name	Author	Description of Information
Admin Records: 05024	9/1/2002	Work Plan Addendum No. 14- RCRA Facility Investigation at SWMU 41/71	URS	Description of activities and contaminents at the flash-burn area (including contaminent release mechanisms)
Admin Records: 05217	9/30/1992	Water Quality Enginering Study No. 31-24-GN53-92	U.S. Army Environmental Hygiene Agency	Water treatment facility data mentions "foaming agents" (Buildings 409, 419, and 4330)
Admin Records: 05827_V1	9/23/1994	Final Report- Air Emission Statement for Radford AAP (Volume I)	Geomet Technologies, Inc.	Mention of foam application for solvent spill tests at Fire Station (Building 222); Mention of Teflon Coating Oven (Building 4903); Mention of photographic operations (Buildings 200, 205, and 220)
Admin Records: 05827_V2	9/23/1994	Final Report- Air Emission Statement for Radford AAP (Volume II)	Geomet Technologies, Inc.	Mention of open burning activities (Propellant Burning Grounds, Building 7219); Mention of degreasing operations (Building 244, Building 4943)
Admin Records: 06386	7/15/1994	Phase 2 Receiving Water Biological Study No. 32-24-H1SM-94	U.S. Army Environmental Hygiene Agency	No relevance to PFAS
Admin Records: 06474	July-August 1994	Executive Summary- Wastewater Management Study No. 32-24-1162-94	U.S. Army Center for Health Promotion and Preventive Medicine	No relevance to PFAS
Admin Records: 06488	9/16/1993	Phase 1- Receiving Water Biological Study No. 32-24-H1SM-93	U.S. Army Center for Health Promotion and Preventive Medicine	No relevance to PFAS
Admin Records: 06737	3/22/1990	Management/Resource Plan for task Order No. 16	Dames & Moore	No relevance to PFAS
Admin Records: 07233	5/1/1993	Final Report- Hazardous Waste Minimization (HAZMIN) Study	Science Applications International Corporation	Mention of solvent storage (Building 1546 and 2546) and reclaim
Admin Records: 07235	6/1/1993	Final Hazardous Waste Minimization (HAZMIN) Study (Phase III Report)	Science Applications International Corporation	Mentions of open burning ground, contaminated waste incinerator, and the propellant/explosive waste incinerator
Admin Records: 07552	1/1/1992	Final Design Analysis/Calculations for Nitrocellulose Block Breaker Facility	Booker Associates, Inc.	No relevance to PFAS
Admin Records: 07553	7/24/1992	Final Design Report for Anhydrous Ammonia Facility	Fluor Daniel, Inc.	No relevance to PFAS
Admin Records: 07554	1987	RCRA Facility Assessment of Radford Army Ammunition Plant	USATHAMA	No relevance to PFAS
Admin Records: 07555	5/1/1991	Expansion of Propellant Wastewater Treatment Plant Building 470	Wiley & Wilson	No relevance to PFAS
Admin Records: 07556	5/1/1991	Expansion of Propellant Wastewater Treatment Plant Building 470	Wiley & Wilson	No relevance to PFAS
Admin Records: 07558	7/25/1978	Installation-Wide Environmental Impact Assessment (Revision 3)	U.S. Army Armament Materiel Readiness Command	No relevance to PFAS
Admin Records: 07559	3/14/1991	Work Plan- West Side Option, Bio-Plant Environmental Site Investigation	Dames & Moore	Includes soil/sediment sample results
Admin Records: 07560	7/1/1992	Cost Proposal for Task 0004	Engineering-Science, Inc.	No relevance to PFAS
Admin Records: 07561	7/1/1992	Cost Proposal for Task 0004	Engineering-Science, Inc.	No relevance to PFAS
Admin Records: 07563	7/1/1990	Site Environmental Assessment of TNT Facility	CNOBG	No relevance to PFAS
Admin Records: 07565	9/25/1991	Annotated Concept Comments for Anhydrous Ammonia Facility	Fluor Daniel, Inc.	No relevance to PFAS
Admin Records: 10005	3/1/1996	Collections Summary for Radford AAP	USACE	No relevance to PFAS

Document Location	Document Date	Document Name	Author	Description of Information
Admin Records: 11996	10/1/1998	Ecological Risk Assessment Approach	ICF Kaiser Engineers, Inc.	No relevance to PFAS
Admin Records: 11997	5/1/1998	Site Management Plan	ICF Kaiser Engineers, Inc.	Mention of Waste Propellant Burning Ground and Contaminated Waste Burning Area (SWMU 17 and SWMU 40)- includes soil and groundwater data)
Admin Records: 11999	12/1/1997	New River and Tributaries Study, Radford AAP	Parsons Engineering Science, Inc.	Includes sediment sample results
Admin Records: 12046	5/5/1999	RFAAP Statistical Inorganic Background Report	Alliant Techsystems	No relevance to PFAS
Admin Records: 12047	3/1/1999	Installation Action Plan		Mention of burn areas and cadmium plating facility
Admin Records: 12420	9/1/2000	Addendum 010: Facility_Wide Background Study	Alliant Techsystems	No relevance to PFAS
Admin Records: 12452	3/1/2001	Installation Action Plan	U.S. Army Materiel Command	Includes site descriptions of burn areas (Flash Burn Parts Area- SWMU 71, Waste Propellant Burning Ground- SWMU 13, Red Water Ash Burial Ground- SWMU 41, Propellant Burning Ash Disposal Area- SWMU 54, Air Curtain Destructor & Open Burning Ground- SWMU 17, Former Lead Furnace Area)
Admin Records: 12459	3/1/2000	Installation Action Plan	U.S. Army Industrial Operations Command	(same as above)
Admin Records: A.M. Kinney Inc - Dec 1983 - Final Report - Hazardous Disch	12/16/1983	Engineering Study of Hazardous/Toxic Discharges from TNT Production Facilities	A.M. Kinney, Inc.	No relevance to PFAS
Admin Records: ADD17-SWMU51-Final	2/1/2004	Work Plan Addendum No. 17- SWMU 51 RCRA Facility Investigation	Shaw Environmental, Inc.	Mention of sludge burning in TNT manufacturing area
Admin Records: agenda_final	11/8/2001	DERP Workshop Agenda	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: AMC ERP Guidance	7/16/1999	U.S. Army Materiel Command Environmental Restoration Program Management Policy and Execution Guidance	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: Army IRP Management Plan	3/1/1999	Installation Restoration Program Management Plan	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: armypolicy	8/17/2001	Army Policy Guidance on Migratory Bird Treaty Act	Department of the Army	No relevance to PFAS
Admin Records: Background Report-USACHPPM	10/1/2001	ARAMS Terrestrial Toxicity Database Background and Description	Parametrix, Inc.	No relevance to PFAS
Admin Records: BkgrdRpt-Final	12/1/2001	Facility-Wide Background Study Report	IT Corporation	Includes soil analyte data
Admin Records: BORING LOGS	12/19/2004	Drilling Record	Parsons Engineering Science, Inc. and Shaw Environmental and Infrastructure, Inc.	No relevance to PFAS
Admin Records: BRAC MANAGEMENT PLAN	4/1/1999	Base Realignment and Closure Environmental Restoration Program Management Plan	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: Brown (AEC) - RCTC	11/1/1999	AMC Active Sites ERP Management Review Workshop	U.S. Army Environmental Center	No relevance to PFAS
Admin Records: BTAGcomparison	1992	BTAG Comparison		No relevance to PFAS
Admin Records: campaignplan	2000	U.S. Army Materiel Command Environmental Campaign Plan	U.S. Army Materiel Command	No relevance to PFAS
Admin Records: cleanstrat	7/1/2003	Army Environmental Cleanup Strategy & Strategic Plan	DAIM- EDC	No relevance to PFAS
Admin Records: Cleanup_Plan	4/24/2003	Army Environmental Cleanup Strategy	Department of the Army	No relevance to PFAS

Administrative Record http://www.radfordaapirp.org/inforepo/Library/1987-01.pdf	June 1987	RCRA Facility Assessment of Radford Army Ammunition Plant Radford, Virginia	A.T. Kearney, Inc.	HWMU-13 Waste propellant burning ground consists of burning pans (7), a former open ground burning area, a runoff settling basin, and a mobile temporary storage unit. Waste propellant accumulated at RFAAP is burned here in metal pans (prior to 1985, burned directly on soil. Ash from these operations was placed in the hazardous waste landfill. Three types of propellants are producted at RAAP:single base (nitrocellulose), double base (nitrocellulose, nitroglycerin) and triple base (nitrocellulose, nitroglycerin, and nitroguanidine). Various signs of release from the pans were evident (remnants of incompletely combusted propellants scattered, charred materials)
Administrative Record http://www.radfordaapirp.org/inforepo/Library/1996-01-V1.pdf	January 1996	RCRA Facility Investigation for Solid Waste Management unites 17, 31, 48, and 54 at Radford Army Ammunition Plant, Virginia	Parsons Engineering Science, Inc.	SWMU-17 Contaminated waste burning area was used for burning wastes potentially contaminated with explosives or propellants and is subdivided into five separate areas (A-E). Waste oil and diesel were used to fuel the burning operations. Materials consisting ofm ostly large metallic items and large combustible items. Wood, paper, and cardboard contaminated with propellants and explosives were often added to increase combustion. Specific areas listed were 17A Stage and Burn Area (large metallic items accumulated here to be burned), 17B Air Curtain Destructor Staging Area (materials accumulated for staging prior to burning), 17C (Air Curtain destructor, burn chamber/large concrete pit, closed in 2005), 17D Air Curtain Destructor Ash Staging Area (ash and scrap metal that remained after burning was stored here, closed in 2005), 17E Runoff drainage basin (below grade and concrete lined settling basin to collect surface water from staging pads).
Administrative Record http://www.radfordaapirp.org/inforepo/Library/1996-01-V1.pdf	January 1996	RCRA Facility Investigation for Solid Waste Management unites 17, 31, 48, and 54 at Radford Army Ammunition Plant, Virginia	Parsons Engineering Science, Inc.	SWMU 54 Propellant and Ash Disposal Area: Ash from propellant burning operations at SWMU13 was disposed of at this unit prior to the hazardous waste landfill SWMU16 (10 tons total). Propellant ash is residue of burning of waste explosives, propellants, and laboratory wastes (propellant and explosive residues, samples, and analytical residues). Groundwater samples taken at the site confirmed low concentrations of two explosives and one VOC, various metals, were present.
Administrative Record http://www.radfordaapirp.org/inforepo/Library/2002-04.pdf	September 2002	Work Plan Addendum No. 14 RCRA Facility Investigation at Solid Waste Management Unit 40/71	URS	SWMU-71 (RFAAP-002) Flash Burn Parts Area: Metal process pipes contaminated with propellant were flash-burned from 1962-1982. Oil-soaked straw was reportedly used on occasion as a fuel source. The pipes were reused or sold for scrap after flash burning. Soil samples collected confirmed the presence of metals (aluminum, iron, chromium) in soils

Document Location	Document Date	Document Name	Author	Description of Information
Administrative Record http://www.radfordaapirp.org/inforepo/Library/2007-06.pdf	August 2007	Decision Document SWMU 68: Chromic Acid Treatment Tanks No Further Action	A.T. Kearney, Inc.	In 1958, rocket motors were reconditioned here using a chromic acid with rust inhibitors rinse. Tanks were used to treat spent chromic acid generated from cleaning rocket encasements. Treated wastewater was then discharged to SWMU69, where chromium-hydroxide sludge precipiated. Site was closed in 1997, involving the removal of treatment ASTs and impacted soil.
Administrative Record http://www.radfordaapirp.org/inforepo/Library/2007-06.pdf	August 2007	Decision Document SWMU 69: Pond by Chromic Acid Treatment Tanks No Further Action	A.T. Kearney, Inc.	SWMU69 received wastewater from chromic acid treatment tanks. Tanks were used for spent chromic acid used to clean rocket encasements. Chromic acid was discontinued in 1974. Wastewater discharged to the pond which was unlined. Discharges to open ground. soil and surface water samples confirmed chromium presence.
Administrative Record http://www.radfordaapirp.org/inforepo/Library/1987-01.pdf	June 1987	RCRA Facility Assessment of Radford Army Ammunition Plant Radford, Virginia	A.T. Kearney, Inc.	SWMU 28: Sanitary Landfill: Began in 1984. Reported that two tons per day of municipal refuse and trash from nearby office buildings and staff houses were placed in the landfill. It is unknown if any hazardous constituents were disposed of in the unit
Administrative Record http://www.radfordaapirp.org/inforepo/Library/2011-01.pdf	January 2011	SWMU 43 RCRA Facility Investigation Report	Shaw Environmental, Inc.	SWMU 43 is a closed unlined sanitary landfill adjacent to New River. Concists of two adjacent cells. Landfill material includes paper, rubber, and plastic debris. Metals and VOCs detected in surface water and groundwater
Administrative Record http://www.radfordaapirp.org/inforepo/Library/1987-01.pdf	June 1987	RCRA Facility Assessment of Radford Army Ammunition Plant Radford, Virginia	A.T. Kearney, Inc.	SWMU 45: Permitted by the Virginia Department of Waste Management. Reported that paper and municipal refuse were the only materials placed in this unit. It is unknown if hazardous materials are present. Soil mounds were noted as well as possible former excavation. Some metal debris was identified (metal part tags, pipes, pipe fittings, springs) as anomalies.
Administrative Record http://www.radfordaapirp.org/inforepo/Library/1987-01.pdf	June 1987	RCRA Facility Assessment of Radford Army Ammunition Plant Radford, Virginia	A.T. Kearney, Inc.	SWMU52: municipal refuse and trash from nearby office buildings and staff houses were placed in this landfill. Daily soil cover was placed on the reuse. It is unknown if hazardous consituents are present in the landfill.
http://www.radfordaapirp.org/inforepo/Library/2002-07.pdf	October 2002	SWMU 6 Decision Document	URS	SWMU 6 is the Acid Wastewater Lagoon. IRP work consisted of soil testing and excavation at the nitrocellulose settling tanks; excavated to 25 feet. Only arsenic exceeded Industrial RBCs.

http://www.radfordaapirp.org/inforepo/Library/2007-01.pdf	April 2017	Building 4343 Interim Measures Completion Report	Shaw Environmental, Inc.	The initial procedures of the plating process involved the cleaning of parts using ammonium nitrate, cold water, Matawan 40-D, and hydrochloric acid baths. Following The cleaning process, the parts went through a series of baths including: cold and hot water, sodium cyanide dip, cadmium plating [using ingots of cadmium (Cdo) and small amounts of cadmium oxide (CdO)], and sodium cyanide rinse water. The process water was collected and stored in the exterior lead-lined catch tank located on the northeast corner of the building. When a sufficient amount of process water accumulated in the tank, it was treated with an alkaline chlorine solution to neutralize the cyanide. This process would also cause trace metals to precipitate and form the sludge contained in the process sumps. then drained through underground pipes to the process water ditch north of Building 4343.
http://www.radfordaapirp.org/inforepo/Library/1992-03-V1.pdf	October 29, 1992	Final Draft Verification Investigation Radford Army Ammunition Plant, Virginia	Dames & Moore	SWMU 29 (Fly Ash Landfill No. 2) used after 1982; SWMU 28 (Fly Ash Landfill No. 1) used prior to 1982. Sludge from SWMU 13 containerized and shipped off-post after February 1990. SWMu 27 and 53 were small disposal areas that are covered by SWMU 29, so all are co-located and grouped for reporting. SWMU 29 is 200 feet east of Closed Sanitary Landfill (SWMU 52).

Len DiIoia Jr.	Natural Resources Manager	17 years		Hazardous Waste, Cultural Resources, Real Property, Operations Chief	540-731-5780 leonard.l.diioia.civ@mail.mil	
Jim McKenna	IRP Manager				540-731-5782 james.j.mckenna16.civ@mail.mil	

Potential Areas of Potential Interest Discussed

Pesticide mixing areas

Wastewater treatment areas

Interview Log		
Installation: RFAAP	Interviewee: DiIoia	Date: 8/6/2019
General Knowledge Discussed		
Mr. DiIoia produces annual pesticide report. He will send most recent one.		
Also has an ASTDR report that can be provided. (report of toxic substances used at installation)		
Dennis Kitts, a former installation employee, has written a book about the history of RFAAP that may be helpful. Book is titled "The Radford Ordnance Works and The New River Ordnance Plant: Seventy-Five Years".		
Wastewater treatment plants:		
"Bioplant" - Receives production wastewater		
Acidic wastewater treatment plant		
Personnel to talk to about wastewater treatment operations - Bill Douglas (BAE Utilities), Matt Alberts (BAE Utilities)		
The finishing area is the drying process area for solvents.		
There was a separate area of the installation called the "New River Unit". This area has been excessed. In the 1940s, the area was a bagging and shipping operation. The remaining portion was for storage of propellants. No other operations occurred on the New River Unit.		
Discussed drinking water intake location (location not listed in this interview log due to OPSEC).		
Large metal scrap from production facilities was flashed then salvaged.		

Interview Log		
Installation: RFAAP	Interviewee: In-brief attendees	Date: 8/6/2019
Documents Obtained		
Pesticide report		
ASTDR report		
Data Gaps or Items for Follow-Up		
Set up interview with Bill Douglas and Matt Alberts (completed)

Potential Areas of Potential Interest Discussed

Fire Stations

Nozzle Testing, Fire Training

Suppression systems

ARCADIS Design & Consultancy for natural and built assets

Interview Log		
Installation: RFAAP	Interviewee: Fire Department	Date: 8/7/2019
General Knowledge Discussed		
Building 222 - main fire station - has 4 bays and adjacent shed with 2 bays		
There was an old fire station across the river in the horseshoe area (now the Rocket office)		
Currently, no foam is stored in fire engine reservoirs. If needed, AFFF buckets are in storage and are only put into the fire engine for energencies. No known incidents. At one point, Engine 2 had AFFF in the reservoir. Fire department personnel assume it was disposed off-post with other waste.		
Only training foam (non-AFFF) is used for training activities. Except for one one training event at the River Warehouse in 2012 (driver training), sprayed AFFF in grassy areas next to road.		
There is no designated training area on-post, the fire department uses the Pulaski County training area off-post for most training.		
Captain Dalton did not find any fire department records/reports where AFFF had been used. No intereviewees have knowledge of any incidents where AFFF was used.		
Building 263 has a halo (airborne) chemical in a suppression system (comm building). All other buildings are water-based suppression systems.		
The fire department has cooperative agreements with Radford city and Pulaski county.		
AFFF is stored in a storage facility built behind the former fire station. The former station also had an associated storage facility (ladder shed) where AFFF may have been stored.		
One interviewee stated that at one point (around 2014) there were empty buckets of AFFF along the side of the bays at the current fire station (assume these are associated with the engine that used to have AFFF in the reservoir, don't know of any uses to put out fires.		
AFFF is stored in large totes near Building 2600 for hook up to an installed fire suppression system in above ground lines surrounding this facility. This facility is the only one on post with a system like this due to extreme flammability of materials used. Training foam was used to test this system when it was installed.		
Firefighters remember several fires, but AFFF was never used.

Suppression systems

Disposal areas

Burn areas

ARCADIS Design & Consultancy for natural and built assets

Interview Log		
Installation: RFAAP	Interviewee: Utitlities Personnel	Date: 8/13/2019
General Knowledge Discussed		
There are a lot of gaskets/spacers used throughout RFAAP, but most would not contain Teflon.		
Very few instances of using Teflon (only in acid facilities) - lined pipes and gaskets in 2-4inch piping (very rare). If removed from machinery, they would have been thrown away in regular trash.		
No recollection of using foam on any fires.		
Building 4903 - Sprayed teflon then dried in large oven. Operation stopped in 1990s because found out material had carcinogens.		
1940s/1950s - Nike/Johns		
1970s/1980s - Trays		
No knowledge of anyone left who knows about the operations.		
Product used was Dupont Teflon.		

Interview Log

Sources

Recognized Primary Source (circle):

Fire, fire training, fire station, nozzle testing, crash site, chromium plating, hangar/aqueous film-forming foam suppression system, auto maintenance, photo processing, fuel spill, pesticide/insecticide use, wash rack, **other: Teflon-coating**

When/Frequency:	Facility used in varying capacities from 1940s to 1990s
Product Released and Volume:	Liquid Teflon paint, unknown volume
Other Notes:	Green Teflon paint (residual overspray) observed dried on walls and floor of facility indicating high use

Recognized Secondary Source(s) (circle):

Stormwater or **sewer system components**, wastewater treatment plants, landfills, remediated soil application sites, **surface water flow pathway**, **potential for groundwater infiltration**, other:

When:	1940s to 1990s
Migration Potential:	Drain from building pipes underground to Stroubles Creek northeast of the facility, Stroubles Creek joins the New River; groundwater discharge to Stroubles Creek/New River northeast of facility
Other Notes:	Historical report indicates drains go to treatment plant; however, utilities personnel checked records, and there is no indication of any historical drains that went to any treatment plants on RFAAP. The only drainage from the facility goes to the Stroubles Creek outfall.

Physical Setting of Potential Area of Potential Interest

Topography and floor/ground surface (note vegetation/pavement, soil composition/color/staining, how surface may influence sampling access, and evidence of erosion especially near point of possible release):

Topography gently sloped northeast toward Stroubles Creek

Vegetation around building is overgrown

Asphalt parking lot cracked

Infrastructure (e.g., note entry to sewer system via drop inlets/storm drains/sanitary sewer/wastewater treatment plant, pavement, buildings):

Building is old but intact, no longer used. Only ovens outside facility are still in use (no longer using Teflon)

Grate at back door of facility captured washout and surface runoff, this drain goes to Stroubles Creek

Ventilation (large stack) in roof of facility would have vented airborne paint particles to outside.

Site Reconnaissance Log
Per- and Polyfluoroalkyl Substances Preliminary Assessment

Installation: RFAAP PAOPI: Teflon-Coating Facility Date: 8/6/2019

On- or off-installation monitoring or drinking water wells (number and proximity to potential area of potential interest, note access and condition of wells):
No wells in vicinity
Surface water drinking water intake along New River is upstream of the facility.
Surface water bodies (proximity to and relative drainage direction and receptor, note ponding or standing water nearby):
Drainage toward Stroubles Creek (approximately 250 yards northeast of site)
Outfall from building sewer line discharges to Stroubles Creek, intersection of Stroubles Creek with the New River is approximately 500 yards north of the outfall point.
No standing water observed during site visit
Surface drainage within or adjacent to (natural or manmade, flow direction, lining [stone, vegetation, other], blockages):
Drain within building observed (area where Teflon was sprayed); drain goes to Stroubles Creek outfall
Site status (current or past IRP and decision [e.g., no further action, monitored natural attenuation, system], previous remedial actions or other perfluorooctane sulfonate/perfluorooctanoic acid investigations):
Closest IRP site is HWMU4 located about 200 yards west of the Teflon-Coating Facility. HWMU4 is a fully closed site. Site was under monitoring for explosives in groundwater. Monitoring wells associated with HWMU4 surrounded the Teflon-Coating Facility; however, all wells are now abandoned.
Miscellaneous notes:
Building is not currently in use. Large oven outside facility is currently used for decontamination (explosives)of large metal equipment.
Residual Teflon paint from overspray observed inside building in paint booth and throughout (green paint).
Health and Safety Considerations
* Please note any health and safety concerns here (e.g., access, overhead/buried utilities, steep terrain, biological hazards).
Rusted metal pieces laying around inside building
Building has not been kept up; main door is not well functioning and heavy

Site Reconnaissance Log
Per- and Polyfluoroalkyl Substances Preliminary Assessment

Installation: **Radford Army Ammunition Plant** **State:** **Virginia**

Date: 8/6/2019
Potential Area of Potential Interest (PAOPI) Name: Old Fire Station 1, Old Ladder Shed, Current Storage Shed
Location Description: All areas co-located inside industrial area
Latitude/Longitude:
Field Personnel: Lauren Henderson, Courtney Ingersoll
Site Contact/Title: Jim McKenna/IRP Manager
Weather: Sunny, hot

Sources

Recognized Primary Source (circle):
Fire, fire training, **fire station**, **nozzle testing**, crash site, chromium plating, hangar/aqueous film-forming foam suppression system, auto maintenance, photo processing, fuel spill, pesticide/insecticide use, wash rack, **other: AFFF storage**

When/Frequency: Old FS and Ladder Shed used from 1940s to 1990s, Current Storage Shed used from ~2015 to present
Product Released and Volume: Unknown due to data gaps in fire department historical knowledge
Other Notes: Potential for incidental AFFF spills during transfer from storage and nozzle testing at fire station

Recognized Secondary Source(s) (circle):
Stormwater or sewer system components, wastewater treatment plants, landfills, remediated soil application sites, **surface water flow pathway**, **potential for groundwater infiltration**, other:

When: 1940s to present
Migration Potential: Area is gravel; therefore, leaching to soil and infiltration to groundwater is most likely pathway
Other Notes: None

Physical Setting of Potential Area of Potential Interest

Topography and floor/ground surface (note vegetation/pavement, soil composition/color/staining, how surface may influence sampling access, and evidence of erosion especially near point of possible release):

Topography is mostly flat, slopes gently to northeast behind facilities.
Area is an open gravel parking lot area, no vegetation surrounding

Infrastructure (e.g., note entry to sewer system via drop inlets/storm drains/sanitary sewer/wastewater treatment plant, pavement, buildings):

Old Fire Station and Old Ladder Shed have been demolished, currently temporary construction trailers are at the site.
Current Storage Shed is intact, building has concrete foundation with no drains

Site Reconnaissance Log
Per- and Polyfluoroalkyl Substances Preliminary Assessment

Installation: RFAAP PAOPI: Old FS 1, Storage Sheds Date: 8/6/2019

On- or off-installation monitoring or drinking water wells (number and proximity to potential area of potential interest, note access and condition of wells):

No wells in vicinity

Surface water drinking water intake along New River is upstream of the facility; however, unsure of groundwater flow direction and where discharge into river is occurring.

Surface water bodies (proximity to and relative drainage direction and receptor, note ponding or standing water nearby):

No surface water bodies in immediate vicinity.

New River located about 0.75 miles from the site in various directions (New River wraps through installation)

Surface drainage within or adjacent to (natural or manmade, flow direction, lining [stone, vegetation, other], blockages):

Surface drainage is most likely to remain on site since flat, some surface runoff may occur northeast of facility area (since topography gently slopes to northeast)

Site status (current or past IRP and decision [e.g., no further action, monitored natural attenuation, system], previous remedial actions or other perfluorooctane sulfonate/perfluorooctanoic acid investigations):

Closest IRP site is HWMU5 located about 400 yards northeast. HWMU5 is a fully closed site. Site was under monitoring for explosives in groundwater.

Miscellaneous notes:

Current Storage Shed contained two Ansulite foam trailers (dated 2017), 265 gallons each.

Also contained pallet of 5-gallon AFFF buckets. 4 pallets were observed (full unopened pallets contained 24 buckets). 112 buckets were counted. One opened pallet appears to be missing 8 buckets.

Health and Safety Considerations

* Please note any health and safety concerns here (e.g., access, overhead/buried utilities, steep terrain, biological hazards).

APPENDIX I

Site Inspection Field Notes

Daily Log

Project Name :	Redford Army Ammunition Plant PFAS SI	**Weather(°F) :**	20-30s, Partly Cloudy, 9 MPH WNW Wind
Project Number :	30001992	**Prepared By:**	Greg Drelich
Purpose :	PFAS SI		
PPE :	Level D		
Equipment:	Turbidity Meter, Water Quality Meter (i.e. YSI), Photoionization Detector (PID)		

Date	Time	Description of Activities
12/08/2020	06:15	Calibrate equipment
12/08/2020	07:30	Leave for site
12/08/2020	07:42	Arrive on site. Prep paperwork.
12/08/2020	07:58	Contacted Andy Wirt. He confirmed TEF-SO-1 is an approved and cleared location. We will meet up at the River Warehouse once we get on site.
12/08/2020	08:10	Bob arrives on site, drillers already on site. Mobilize to get through security to meet with Andy.
12/08/2020	08:31	Arrive at River warehouse to meet with Andy and conduct tailgate safety meeting. Sign off on a River warehouse permit.
12/08/2020	09:10	Begin setup on RW-SO-1
12/08/2020	09:15	Collect soil sample: RFAAP-RW-SO-1-0-2-120820 (Collect MS/MSD)
12/08/2020	09:15	Collect FD: RFAAP-FD-1-SO-120820
12/08/2020	09:56	At RW-SO-1, DRILL TO 20', DTW= 15.8' Dust trax = 0.015 mg/m3
12/08/2020	10:00	Setup to gw sample
12/08/2020	10:30	Collect GW Sample: RFAAP-RW-GW-1-120820
12/08/2020	10:59	Arrive at Teflon Coating AOPI
12/08/2020	11:05	Collect soil sample: RFAAP-TEF-SO-1-0-2-120820
12/08/2020	11:38	Dust trax reading is maxing at 0.246 mg/m3
12/08/2020	11:50	TEF-SO-1 bored to 15', DTW measured at 5.40'
12/08/2020	12:00	Begin purging RFAAP-TEF-GW-1
12/08/2020	12:10	Well went dry. Not collecting MS/MSD or Dup here due to limited sample quantity.
12/08/2020	12:20	Collect GW Sample: RFAAP-TEF-GW-1-120820
12/08/2020	12:30	Collect field blank: RFAAP-FB-1-120820
12/08/2020	13:05	Collect soil sample: RFAAP-TEF-SO-2-0-2-120820
12/08/2020	13:32	Refusal at TEF-SO-3. Depth = 13', DTW=10.5'
12/08/2020	13:55	Collect gw sample: RFAAP-TEF-GW-3-120820 Well went dry and sample is getting filled on recharge.
12/08/2020	14:05	Arrive at TEF-2
12/08/2020	14:10	Collect soil sample: RFAAP-TEF-SO-2-0-2-120820
12/08/2020	14:40	Hit refusal at TEF-2 at 12'. There was a wet layer at around 11'. Waited for it to recharge and gauged it, but did not produce water. No groundwater sample was collected here. Same type of gray bedrock refusal at TEF-3.

ARCADIS Design & Consultancy for natural and built assets

Daily Log

12/08/2020	15:05	Arrive at 31MW1. Well is active and has a transducer in it. DTW = 34.50 Setup on well
12/08/2020	16:00	TD = 52' Intake = 48'
12/08/2020	16:05	Attempt to pump, but MP-10 controller is not work. Contact QED and get instructions to reset controller.
12/08/2020	16:15	Attempt to run pump again, but it doesn't work. Pack up equipment.
12/08/2020	16:30	Collect Equipment Blank on drill shoe: RFAAP-EB-1-120820
12/08/2020	16:35	Collect Equipment Blank on hand auger: RFAAP-EB-2-120820
12/08/2020	16:45	Collect equipment blank on water level meter: RFAAP-EB-3-120820
12/08/2020	17:15	Offsite
12/08/2020	17:45	Arrive at hotel, end of day.

Project Name : Redford Army Ammunition Plant PFAS SI

Project Number : 30001992

Purpose : PFAS SI

PPE : Level D

Equipment:

Weather(°F) : 30-40s, Cloudy, Snow/Rain

Prepared By: Greg Drelich

Date	Time	Description of Activities
12/07/2020	07:00	Begin loading vehicle
12/07/2020	07:15	Leave for site
12/07/2020	07:30	Arrive at Redford Visitor's Center and begin prepping. Fill out tailgate safety form, will conduct meeting upon arrival of crew
12/07/2020	07:50	Bob Campion arrives on site
12/07/2020	08:30	EnviroCheck arrives on site
12/07/2020	08:40	Get paperwork for temporary badges. Talk with Andy Wirt and Kevin Toth about access and plan for the day. Line at visitors center is long and will take time. Additionally, GORS notified me they will not be on site until 1030. Bob is required for everyone to get temp badges, so we will have to wait for gprs to get our temporary badges because we all have to be present at the same time to get on site.
12/07/2020	10:30	GPRS arrives on site. Attempt to get badges, visitors center is overly crowded and socially distancing is not possible. Some people inside are not wearing face masks. Arcadis and subs will wait in vehicle for visitors center to clear out. Will check in occasionally to check the line progress.
12/07/2020	12:30	Obtain visitors badge that is valid through 12/9/20. Still waiting on others to get their badges.
12/07/2020	12:46	Everyone got their badges, begin mobilizing inside.
12/07/2020	13:05	Bob has to get a different sub contractor badge to access inner gate
12/07/2020	14:44	Meet at river warehouse with Andy Wirt and Matt with BAE Systems. Matt has drawings showing utilities in our locations. Clear an area with GPRS. Andy says no utilities in the area of marking. Moved location slightly west to be away from overhead utilities.
12/07/2020	15:00	Mobilize to Teflon coating AOPI to clear TEF-1 location to allow for 811 sewer workers offsite after they clear it. Moved location across roadway (north) because drill rig would not be able access original location. The location was cleared by GPRS, Matt with BAE Systems, and 811.
12/07/2020	15:57	Mark TEF-3 location. Cleared by GPR and BAE. Bob Campion left to sign off on permits while we continue clearing locations.
12/07/2020	16:00	Mark TEF-2 and clear with GPR and BAE.
12/07/2020	16:10	Move location that was cleared earlier at River Warehouse to location adjacent to bridge in same AOPI. On my mapping, RW-4 and RW-1 were swapped, so cleared the correct RW-1 this time. GPRS and BAE clear the location.
12/07/2020	16:40	Clear the OFS2-1 location with GPRS and BAE. Bob and Andy join us after the signed off on permits. GPRS mobilizes offsite with Bob. I go with Matt to locate 31MW1.
12/07/2020	17:10	Locate 31MW1, but lid is rusted shut. Will return tomorrow to attempt and open the well to see if it is active. Offsite.
12/07/2020	17:30	Arrive at hotel, end of day.

Project Name : RAAP PA/SI Sampling Event
Project Number : 30001992
Purpose : PFAS Sampling
PPE : Level D
Equipment: Water Quality Meter (i.e. YSI), Turbidity Meter

Weather(°F) : Cloudy
Prepared By: Abby Harmon

Date	Time	Description of Activities
01/05/2021	06:00	Leave Hotel after tailgate safety meeting
01/05/2021	06:20	Stop for gas, ice, and water
01/05/2021	06:38	Arrive at Visitor's Center, wait for it to open.
01/05/2021	07:10	Brady and Abby both badged for access Jan 5-6.
01/05/2021	07:18	Call Bob. He said he's about 30 minutes from site.
01/05/2021	07:45	Calibrate YSI and Turbidity meter
01/05/2021	08:20	Mob into site with Bob
01/05/2021	09:18	Start set up at MW-31
01/05/2021	10:05	Sample RFAAP-31MW-010521, collect FD and MSMSD
01/05/2021	10:30	Collect DEB-RFAAP-31MW1-DEB-1-010521 from transducer
01/05/2021	11:35	Collect RFAAP-NR-SW-1-010521
01/05/2021	00:10	Collect RFAAP-NR-SW-2-010521
01/05/2021	00:55	Collect RFAAP-OFS2-SO-1(0-2)-010521 also collect grain size, TOC, and pH.
01/05/2021	13:15	Collect RFAAP-OFS2-SO-2(0-2)-010521
01/05/2021	13:25	Collect RFAAP-OFS2-SO-3(0-2)-010521
01/05/2021	13:50	Collect RFAAP-RW-SO-2-(0-2)-010521
01/05/2021	14:00	Collect RFAAP-RW-SO-2-(0-2)-010521
01/05/2021	14:15	RFAAP-RW-SO-4-(0-2)-010521
01/05/2021	14:50	RFAAP-TEF-SO-4-(0-2)-010521
01/05/2021	15:00	Collect RFAAP-TEF-SD-1-010521, collect MS/MSD and RFAAP-FD-1-SD-010521
01/05/2021	15:05	Collect RFAAP-TEF-SW-1-010521, collect MS/MSD and RFAAP-FD-1-SW-010521
01/05/2021	15:30	Meet up with Jim. He drives us over to the remaining surface water locations at OFS1 and CFS. No water was present when we arrived at these locations.
01/05/2021	17:00	Leave site

Prepared By: Abby Harmon

Date	Time	Description of Activities
01/06/2021	07:30	Arrive at site
01/06/2021	08:00	Meet Bob at visitors Center and enter site through security portal
01/06/2021	09:10	Collect RFAAP-OFS1-SO-1-(0-2)-010621. Ground very firm, so will collect ms/msd and grain size, TOC and pH at a different location.
01/06/2021	09:35	Collect RFAAP-OFS1-SO-2-(0-2)-010621. Collect ms/msd and grain size, TOC and pH. Collect RFAAP-FD-2-SO-010621. Jim arrives.
01/06/2021	10:20	Collect RFAAP-OFS1-SO-3-(0-2)-010621
01/06/2021	22:30	Collect RFAAP-OFS1-SO-5-010621
01/06/2021	11:30	Collect RFAAP-CFS-SO-1-(0-2)-010621 also collect the for grain size, TOC, and pH.
01/06/2021	11:40	Collect RFAAP-CFS-SO-2-(0-2)-010621
01/06/2021	11:50	Collect RFAAP-CFS-SO-3-(0-2)-010621
01/06/2021	12:00	Collect RFAAP-CFS-SO-4-(0-2)-010621
01/06/2021	12:30	Move to parking lot across street from CFS to collect remaining equipment blanks.
01/06/2021	13:05	Collect RFAAP-EB-5-010621 from hand trowel
01/06/2021	13:10	Collect RFAAP-EB-4-010621 from bladder pump
01/06/2021	13:15	Collect RFAAP-FB-2-010621
01/06/2021	13:20	Collect RFAAP-SB-1-010621 from Water used for decon
01/06/2021	13:30	Call Andy and discuss groundwater IDW sampling. Andy meets us in parking lot.
01/06/2021	14:00	Collect RFAAP-IDW-GW-010621 from groundwater IDW.
01/06/2021	14:30	Jim leaves, Andy takes us to the 90 day accumulation area. Remaining IDW (approximately 2 gallons) is turned over to Andy.
01/06/2021	15:00	Leave site

ARCADIS

DAILY LOG

Project No.: 30001993

Site Location: Radford Arsenal RFAAP

Prepared By: Bob Campion

Date	Time	Description of Activities
4-18-22	0930	Onsite w/ GRE - Nate Kollar - Got visitors badge for Nate, called Melissa Lincoln w/ BAE to let her know we were onsite, met w/ Melissa & Andy Wirt & completed General PTW & Hot PTW. Area for proposed location "OFS1" Old fire station 1 is completely barricaded by steam vent pipes & only way in is behind current storage shed. Pipes are over head in that area but w/ only 6-7 Ft clearance marked out proposed area but called Kevin to let him know we probably will not be able to access that area due to drill rig not being able to fit. Will verify w/ Parratt Wolff when they arrive. Moved on to 2nd proposed area "OFS2" (a old fire station 2. No problems or issues w/ that area - marked out & no anomalies in that area. Kevin called back & informed me to offset "OFS1" to area behind current storage shed right before overhead steam pipes. Marked out area - no anomalies. Escorted Nate out then escorted Parratt Wolff & United Rentals w/ skid steer in to OFS1 area. Had to enter site using

Date	Time	Description of Activities
		shipping & receiving entrance due to tractor trailer to big to come through gate 1. That entrance closes @ 1630. Contacted fire dept to get adapter to hydrant for drillers water. Mid day safety meeting @ 1430 discuss SOW, hazards, etc. PW unload drill rig & perform equip check. Filled 2 totes w/ water for drill rig. Everything setup & ready to start tomorrow morning. Drove down to 2nd area to show drillers that location then drove out. off site @ 1700.

ARCADIS

DAILY LOG

Project No.: 30001992

Site Location: Radford Arsenal

Page 1 of 1

Prepared By: Bob Campion

Date	Time	Description of Activities
4-19-22	0700	Meet Drillers on site @ welcome center. Go through 2 security checkpoints to area of OFS1 - Tailgate safety meeting - cold temp today dress accordingly. SOW - install temp wells - OFS1 & OFS2 develop/sample. Drilled OFS1 to 30 ft - water @ 25.15 set @ 1" screen & capped w/ J-Plug - moved to location for OFS2 - @ 20-25 ft water gushed out after pulling core tube - drilled on to 50' where we hit rock - see soil boring logs - Placed soil from coil tubes in 2 zip Locks in 0-5 ft intervals - let sit in truck for 45 mins to 1 hr & screened w/ PID - see soil boring logs - will let both wells sit overnight & will pump/ sample tomorrow - have to meet John Nelson to get 1" QED pump because I ordered 2" bladder from Pine & PW only brought 1" screen offsite @ 1630 to Charleston W/ to meet John w/ pumps

ARCADIS

DAILY LOG

Project No.: 30001992 Page 1 of 1

Site Location: Radford Arsenal

Prepared By: Bob Campion

Date	Time	Description of Activities
4-20-22	0730	Arrive on site @ welcome center w/ PW go through both security check points - down to OFS2 - tail gate safety meeting. gauge well today DTW is 37.05 yesterday was 37.5. Setup Pump on OFS2 & low flow sampled. - See GW sampling log for notes & readings. Collected MS/MSD on OFS2 - will let field team know of this mistake because MS/MSD was supposed to be on OFS1. - See field notes for OFS1 on GW sampling form. only enough PFAS Free water was sent by lab for only 1-250mL bottle for rinse & Equip blanks off equip. - would've ran out if I would've filled 2 bottles. Unable to get ambient air field blank - "RFAAP-FB-3-MMDDYY" not enough water sent by lab. All samples on ice PW able to use all removed soil from borings to fill holes plus bags of sand. Clean up area, load equip - PW called United to schedule p/u of skid steer - United said it could be Friday before they could get out there to get it. Left skid steer parked next to OFS1 in gravel lot.

Left approx 2 gal of purge water in 5gal bucket w/ lid per RFAAP request with Andy Wirt for their sampling lab. Escort PW off site through shipping & receiving entrance/Exit @ 1600

APPENDIX J

Site Inspection Field Forms

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations onsite during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: Radford Army Ammunition Plant- SI **Project Location:** Radford, VA

Project Number: 30001992 **Date:** 01/06/2021 **Time:** 08:00

Conducted By: Abby Harmon **Signature:**

Client and Sub-Contractore details

Client Name: US Army Corps Of Engineers - General **Client Contact:** Andy Wirt **Sub-Contractore Companies:**

Tracking the Tailgate Meeting

Think through the Tasks(List the tasks for the day): Groundwater, surface water, and soil sampling

Other Hazardous Activities - Check the box if there are any other Arcadis, Client or other party activities that may pose hazards to Arcadis operations — Yes ☐ None ☑

Describe them here and how will they be controlled?

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☑ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☐ Excavation/Trenching		☐ Hot Work	
☐ Mechanical Lifting Ops		☐ Overhead & Buried Utilities		☐ Other permit	

Discuss following questions (for some review previous day's post activities). Check if yes:

☐ Incidents from day before to review?	☐ Lessons learned from the day before?	☐ Any Stop Work Interventions yesterday?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ If deviations, notify PM & client
☐ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☐ All equipment checked & OK?
☐ Staff has appropriate PPE?	☐ Staff knows Emergency Plan (EAP)?	☐ Staff knows gathering points?
		☐ Topics from Corp H&S to cover?

Comments:

Recognize the hazards (check all those that are discussed) (Examples are provided) and Assess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

M	Gravity (i.e.,ladder, scaffold, trips)	(L M H)	M	Motion (i.e., traffic, moving water)	(L M H)	L	Mechanical (i.e.,augers, motors)	(L M H)
L	Electrical (i.e., utilities, lightning)	(L M H)	L	Pressure (i.e., gas cylinders, wells)	(L M H)	M	Environment (i.e., heat, cold, ice)	(L M H)
L	Chemical (i.e., fuel, acid, paint)	(L M H)	L	Biological (i.e., ticks, poison ivy)	(L M H)	L	Radiation (i.e., alpha, sun, laser)	(L M H)
M	Sound (i.e., machinery, generators)	(L M H)	L	Personal (i.e. alone, night, not fit)	(L M H)	M	Driving (i.e. car, ATV, boat, dozer)	(L M H)

Comments: Watch step while walking through fields, rocky areas near streams, etc., Be aware of surroundings near roads and streams, Very cold. Take breaks to warm up when needed, Use ear plugs in area with sound, Use smith safety systems

Provide Description of Assessing the Risks:

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JLAs, and other control processes. Discuss and document any additional control processes.

☑ **STOP WORK AUTHORITY** (Must be addressed in every Tailgate meeting - (See statements below)

☐ Elimination	☐ Substitution	☐ Isolation
☐ Engineering controls	☐ Administrative controls	☐ Monitoring
☐ General PPE Usage	☐ Hearing Conservation	☐ Respiratory Protection
☐ Personal Hygiene	☐ Exposure Guidelines	☐ Decon Procedures
☐ Emergency Action Plan (EAP)	☐ Fall Protection	☐ Work Zones/Site Control
☐ JSA to be developed/used (specify)	☐ TIP conducted (specify job/JSA)	☐ Traffic Control
		☐ Reviewed COVID Protocols

Summary of Discussion:

Signature and Certification Section - Site Staff and Visitors

Name	Company	Employee Task	Site Staff and Visitors Signature	Sign In Time	Sign Out Time	I have read and understand the HASP
				#Error		

Visitor Name/Co - not involved in work	In Time	Out Time

Important Information and Numbers:

1. All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.
2. In the event of an injury, employees will call WorkCare at 1.888-449-7787 and then notify the field supervisor who will then notify the Project or Task Manager.
3. In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify the Project or Task Manager.
4. In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify the Project or Task Manager.

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to STOP THE JOB, I will perform TRACK; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work

Please describe any lessons learned, best practices learned, incidents that may have occurred, any stop work interventions, corrective/preventative actions needed and other H&S issues below.

Overall Comments:

RFA-RW-SO-1, (0-2') SILT, fine, trace (<10%) fine sand, trace (<10%) clay

Boring ID - Soil Description	RFA-RW-SO-1
Soil Description Combined	(0-2') SILT, fine, trace (<10%) fine sand, trace (<10%) clay
Start Depth (ft)	0
End Depth (ft)	2
Primary Component	SILT
Primary Grain Size	fine
Secondary Modifier	trace (<10%)
Secondary Component	fine sand
Tertiary Modifier	trace (<10%)
Tertiary Component	clay
Plasticity (applies to fines)	Low plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Dry
Density/Consistency	Soft
Sample Color	Brown
USCS/Graphic	ML

RFA-RW-SO-1, (2-5') SILT, fine, trace (<10%) fine sand, trace (<10%) clay

Boring ID - Soil Description	RFA-RW-SO-1
Soil Description Combined	(2-5') SILT, fine, trace (<10%) fine sand, trace (<10%) clay
Start Depth (ft)	2
End Depth (ft)	5
Primary Component	SILT
Primary Grain Size	fine
Secondary Modifier	trace (<10%)
Secondary Component	fine sand
Tertiary Modifier	trace (<10%)
Tertiary Component	clay
Plasticity (applies to fines)	Low plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted

Field Moisture	Dry
Density/Consistency	Soft
Sample Color	Brown
USCS/Graphic	ML

RFA-RW-SO-1, (5-10') SILT, fine, trace (<10%) fine sand

Boring ID - Soil Description	RFA-RW-SO-1
Soil Description Combined	(5-10') SILT, fine, trace (<10%) fine sand
Start Depth (ft)	5
End Depth (ft)	10
Primary Component	SILT
Primary Grain Size	fine
Secondary Modifier	trace (<10%)
Secondary Component	fine sand
Plasticity (applies to fines)	Low plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Moist
Density/Consistency	Soft
Sample Color	Brown
USCS/Graphic	ML
Notes	1.5 feet unrecovered
Line Type	None

RFA-RW-SO-1, (10-15') SAND, fine, trace (<10%) silt

Boring ID - Soil Description	RFA-RW-SO-1
Soil Description Combined	(10-15') SAND, fine, trace (<10%) silt
Start Depth (ft)	10
End Depth (ft)	15
Primary Component	SAND
Primary Grain Size	fine
Secondary Modifier	trace (<10%)
Secondary Component	silt
Angularity (applies to coarse grained materials)	Subangular
Plasticity (applies to fines)	Non-plastic
Dilatency (applies to fines)	Rapid dilatency
Sorting	Well sorted
Field Moisture	Moist
Density/Consistency	Soft
Sample Color	Brown
USCS/Graphic	SM
Notes	2.5’. Unrecovered

RFA-RW-SO-1, (15-20') SAND, fine, trace (<10%) silt

Boring ID - Soil Description	RFA-RW-SO-1
Soil Description Combined	(15-20') SAND, fine, trace (<10%) silt
Start Depth (ft)	15

End Depth (ft)	20
Primary Component	SAND
Primary Grain Size	fine
Secondary Modifier	trace (<10%)
Secondary Component	silt
Angularity (applies to coarse grained materials)	Subangular
Plasticity (applies to fines)	Non-plastic
Dilatency (applies to fines)	Rapid dilatency
Sorting	Well sorted
Field Moisture	Wet
Density/Consistency	Soft

RFAP-TEF-SO-3, (2-7') CLAY, fine, little (10-20%) large pebbles, little (10-20%) silt

Boring ID - Soil Description	RFAP-TEF-SO-3
Soil Description Combined	(2-7') CLAY, fine, little (10-20%) large pebbles, little (10-20%) silt
Start Depth (ft)	2
End Depth (ft)	7
Primary Component	CLAY
Primary Grain Size	fine
Secondary Modifier	little (10-20%)
Secondary Component	large pebbles
Tertiary Modifier	little (10-20%)
Tertiary Component	silt
Angularity (applies to coarse grained materials)	Subangular
Plasticity (applies to fines)	High plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Dry
Density/Consistency	Stiff
Sample Color	Brown
USCS/Graphic	CL
Notes	Thin black layer at 2 feet

RFAP-TEF-SO-3, (7-10') SILT, very fine, trace (<10%) fine sand, trace (<10%) medium pebbles

Boring ID - Soil Description	RFAP-TEF-SO-3
Soil Description Combined	(7-10') SILT, very fine, trace (<10%) fine sand, trace (<10%) medium pebbles
Start Depth (ft)	7
End Depth (ft)	10
Primary Component	SILT
Primary Grain Size	very fine
Secondary Modifier	trace (<10%)
Secondary Component	fine sand
Tertiary Modifier	trace (<10%)
Tertiary Component	medium pebbles
Angularity (applies to coarse grained materials)	Subangular
Plasticity (applies to fines)	Low plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Moist
Density/Consistency	Medium stiff
Sample Color	Brown
USCS/Graphic	ML

RFAP-TEF-SO-3, (10-13') SAND, fine, some (21-35%) large pebbles, trace (<10%) silt

Boring ID - Soil Description	RFAP-TEF-SO-3
Soil Description Combined	(10-13') SAND, fine, some (21-35%) large pebbles, trace (<10%) silt
Start Depth (ft)	10
End Depth (ft)	13
Primary Component	SAND
Primary Grain Size	fine
Secondary Modifier	some (21-35%)
Secondary Component	large pebbles
Tertiary Modifier	trace (<10%)
Tertiary Component	silt
Angularity (applies to coarse grained materials)	Subangular
Plasticity (applies to fines)	Non-plastic
Dilatency (applies to fines)	Rapid dilatency
Sorting	Well sorted
Field Moisture	Wet
Density/Consistency	Medium stiff
Sample Color	Brown to Gray
USCS/Graphic	SM
Notes	Gray from 12-13’ Refusal at 13’

Boring ID - Analytical Samples	RFAP-TEF-SO-3
Sample Matrix	soil
Sample Type	Composite
Sample ID	RFAAP-TEF-SO-3-0-2-120820
Sample Start Depth (ft)	0
Sample Length (in)	2
Sample Date	2020-12-08
Sample Time	13:05

PFAS

Analyses	PFAS
Sample Container	250 mL HDPE
Number of Containers	1

RFAP-TEF-SO-2, 12

Boring ID	RFAP-TEF-SO-2
Start Date	2020-12-08
Time	13:00
End Date	2020-12-08
Time	14:05
Subcontractor	EnviroCheck
Driller	Jacob Rhudy, James Price
Field Personnel	Greg Drelich
Drilling Method	Direct-Push
Drilling Fluid	Distilled Water

Drilling Rig	Geoprobe
Sampling Method	Hand Auger
Sampling Interval (ft)	2
Pavement Thickness (in)	0
Borehole Diameter (in)	2.25
Field Screening Type	PID
Field Screening Model	RKI Eagle GX-6000
Disposition of Drill Cuttings	Backfill
Converted to Well	No
Borehole Completion	Backfill
Total Depth (ft)	12
Weather Conditions	Partly Sunny
Weather	Partly Sunny
Temperature (F)	30
Remarks	Cuttings will be backfilled and excess will be drummed. Hand augering to 5’ and sampling 0-2’. DPT beyond 5’.

RFAP-TEF-SO-2, 5

Boring ID - Field Screening	RFAP-TEF-SO-2
Depth (ft)	5
PID/FID Value	2.4

RFAP-TEF-SO-2, 10

Boring ID - Field Screening	RFAP-TEF-SO-2
Depth (ft)	10
PID/FID Value	1.8

RFAP-TEF-SO-2, 12

Boring ID - Field Screening	RFAP-TEF-SO-2
Depth (ft)	12
PID/FID Value	1.6

RFAP-TEF-SO-2, (0-2') CLAY, fine, little (10-20%) silt

Boring ID - Soil Description	RFAP-TEF-SO-2
Soil Description Combined	(0-2') CLAY, fine, little (10-20%) silt
Start Depth (ft)	0
End Depth (ft)	2
Primary Component	CLAY
Primary Grain Size	fine
Secondary Modifier	little (10-20%)
Secondary Component	silt
Plasticity (applies to fines)	Medium plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Dry
Density/Consistency	Medium stiff
Sample Color	Brown

USCS/Graphic	CL

RFAP-TEF-SO-2, (2-5') CLAY, very fine, trace (<10%) silt

Boring ID - Soil Description	RFAP-TEF-SO-2
Soil Description Combined	(2-5') CLAY, very fine, trace (<10%) silt
Start Depth (ft)	2
End Depth (ft)	5
Primary Component	CLAY
Primary Grain Size	very fine
Secondary Modifier	trace (<10%)
Secondary Component	silt
Plasticity (applies to fines)	Medium plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Dry
Density/Consistency	Stiff
Sample Color	Brown
USCS/Graphic	CL

RFAP-TEF-SO-2, (5-10') CLAY, very fine, trace (<10%) medium pebbles to fine sand

Boring ID - Soil Description	RFAP-TEF-SO-2
Soil Description Combined	(5-10') CLAY, very fine, trace (<10%) medium pebbles to fine sand
Start Depth (ft)	5
End Depth (ft)	10
Primary Component	CLAY
Primary Grain Size	very fine
Secondary Modifier	trace (<10%)
Secondary Component	medium pebbles
Secondary Component 2	to fine sand
Angularity (applies to coarse grained materials)	Subangular
Plasticity (applies to fines)	Medium plasticity
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Moist
Density/Consistency	Stiff
Sample Color	Brown
USCS/Graphic	CL

RFAP-TEF-SO-2, (10-11') SILT, fine, and (36-50%) fine sand, trace (<10%) small pebbles

Boring ID - Soil Description	RFAP-TEF-SO-2
Soil Description Combined	(10-11') SILT, fine, and (36-50%) fine sand, trace (<10%) small pebbles
Start Depth (ft)	10
End Depth (ft)	11
Primary Component	SILT
Primary Grain Size	fine
Secondary Modifier	and (36-50%)
Secondary Component	fine sand

Tertiary Modifier	trace (<10%)
Tertiary Component	small pebbles
Angularity (applies to coarse grained materials)	Subangular
Plasticity (applies to fines)	Low plasticity
Dilatency (applies to fines)	Slow dilatency
Sorting	Well sorted
Field Moisture	Wet
Density/Consistency	Soft
Sample Color	Brown
USCS/Graphic	SM

RFAP-TEF-SO-2, (11-12') SAND, fine, and (36-50%) weathered bedrock

Boring ID - Soil Description	RFAP-TEF-SO-2
Soil Description Combined	(11-12') SAND, fine, and (36-50%) weathered bedrock
Start Depth (ft)	11
End Depth (ft)	12
Primary Component	SAND
Primary Grain Size	fine
Secondary Modifier	and (36-50%)
Secondary Component	weathered bedrock
Angularity (applies to coarse grained materials)	Angular
Plasticity (applies to fines)	Non-plastic
Dilatency (applies to fines)	No dilatency
Sorting	Well sorted
Field Moisture	Dry
Density/Consistency	Firm
Sample Color	Gray
USCS/Graphic	SW

AREA ENTRY PERMIT

(NO HOT WORK IS AUTHORIZED BY THIS PERMIT)

Date 4-18-22

This permit is strictly for the scope of work and limitations stated below and will not be expanded or deviated from by the personnel performing the work.

Permit issued to Bob Campion

Area of Work: Old Fire Station / Rocket Office

Description of work to be performed: Soil borings, monitor well install, ground water sampling, utility markout

Special Precautions and / or Limitations to be followed: proper PPE, follow plant procedures

This permit is authorizing entry for the following period:

Beginning 4-18-22 20___ at 0700 a.m. / p.m.

and ending 4-20-22 20___ at 5:00 a.m. / p.m.

The work scope and job site have been inspected and are approved for the work as described above.

Operating Department	Engineer
Safety Department	Contractor's Representative (Bob Campion)

WHITE = SAFETY YELLOW = ENGINEERING PINK = OPERATING DEPARTMENT GOLD = SUBCONTRACTOR

Does Not Contain Export Controlled Information – BAE Systems Proprietary – Hard Copy Uncontrolled – Verify Current Revision

BAE SYSTEMS

RA-604

Rev. 0 (3/6/2019)

BAE Systems INC.
Subcontractor Hot Work Permit

Location Fire Station Bay # _____ Owner _____

Subcontractor Authorized Arcadis, Jason & Wolfe

Devices to be used Drill rig, hand auger

Scope of work (in detail) install monitoring wells (2), Ground water sampling, soil sampling

Special Precautions Proper PPE, follow plant procedures

Checklist ✓ Appropriate conditions met for approval

___ Combustibles 50' from Hot Work	✓ Extinguisher on site	
___ Hot Work adjacent to combustibles	___ Charged water hose	
___ Combustibles covered	___ Bldg Protection	
___ Floor or wall openings protected	___ Piping Protected	
___ Conveyors/chutes protected	___ Bldg posted	
___ Vapors contained so not to enter	___ Welding Blanket Req'd	
___ Fresh air required	___ CSE required	
___ Exhaust required	___ Area to be kept wet	Model _____
___ Flashing required	___ NG remover required	Row# _____
___ Floor swept clean of combustibles	___ LEL Reading ____%	Last cal. _____

Special PPE Required

Fire watch	☐ Required ☐ Not Required

Utilities and Structures Checklist

ARCADIS Design & Consultancy for natural and built assets

THIS FORM MUST BE COMPLETED IN ENTIRETY PRIOR TO BEGINNING ANY INTRUSIVE WORK

Project: USAEC PFAS PA/SI Program
Project Number: 30001993
Form Completion Date: 4-18-22 Form Expiration Date: 4-20-22
All utility markings must be refreshed ≤15 days when work is ongoing. (15 business days post form completion date)

Pre-Field Work

Required: One Call or "811" notified 48-72 hours in advance of work? #: A209701740-00A
Ticket Expiration Date 4-29-22 (Review State Requirements) A209701693-00A
Utility companies notified during the One Call process ☒ See attached ticket

List any other utilities requiring notification: ☐ None

Private Locator Contacted ☒ Yes ☐ No

Plan private utility clearance subcontractor assignments, areas, required clearance equipment, depth of clearance needed, types of utilities. When possible re-clear 811 markings to confirm utility locations.

Client provided utility maps or "as built" drawings showing utilities? ☒ Yes ☐ No

Field Work - This must be completed on site, by staff who have a minimum of one year of field experience in identifying utilities. Review Check list with PM or designee prior to beginning intrusive work.
Mechanized intrusive work in utility Tolerance Zone (<30-in.) requires pre-approval by Corporate H&S

List Soil Boring / Well IDs or Excavation Locations applicable to this clearance checklist:
OFS1-GW1
OFS2-GW1

3 Reliable Lines of Evidence Required Prior to Starting any Subsurface Intrusive Work
☒ One Call/"811" (Reliable as a line of evidence when working in public right of way or easement)
Utility Markings Present: ☒ Paint ☐ Pin flags/stakes ☐ Other ☐ None

☒ Client Provided Maps/Drawings **OR** ☐ Maps/Drawings requested but not provided
☐ Client Clearance Name(s)/Affiliation(s)
☐ Interview(s): Name(s)/Affiliation(s)

Did person(s) interviewed indicate depths of any utilities in the subsurface?
☐ Yes, depths provided:
Additional Comments:
☒ Did not know or refused to answer

☐ Site Inspection (**Complete Page 2 & Photo Document Marked Utilities & Utility Structures**)
☐ Public Records / Maps / As-Builts
☐ **Private Locator: (Name and Company)** Nate Kollar / GRE
☒ Ground Penetrating Radar (GPR)
☒ Radiofrequency (RF Loc)
☒ Electromagnetic (EM)
☐ Metal Detector

Soft Dig Methods
☐ Termination Depth 40/150 ft. bgs
☐ Potholing / Vacuum Extraction
☐ Air knife ☐ Hydro knife
☒ Probing
☒ Hand Auguring ~5ft

Tips for Successful Utility Location (H&S Standard Section 5.6):
1. Don't forget to look up (mark above grade utilities if warranted)
2. Be on-site with Private Utility Locators
3. Ask Private Locators to "confirm" other's markings
4. Select alternate/backup locations during clearance process
5. Mark out all known utilities. Leave nothing to question
6. No hammering - no pickaxes - no digging bars - no shortcutting
7. No excessive turning or downward force of hand augers/shovels
8. Utilities may run in or directly under asphalt/concrete
9. Clearing, grubbing, and heavy equipment may damage shallow utilities.
10. Is Spotter needed for Heavy Equipment near aboveground utilities?

☐ Other: OFS1-40ft, OFS2-150ft
☐ Marine Locator: (Name and Company)

Utilities and Structures Checklist

ARCADIS Design & Consultancy for natural and built assets

During the site inspection look for the following: **("YES" requires additional investigation and the utility must be marked properly prior to beginning subsurface intrusive work)**:

Site Inspection	Utility Color Codes	Present	
A) Natural gas line present (evidence of a gas meter)?	Yellow	☐ Yes	☑ No
i) Feeder Lines to buildings or homes?		☐ Yes	☑ No
B) Evidence of electric lines:	Red		
i) Conduits to ground from electric meter or along wall?		☐ Yes	☑ No
ii) Conduits from power poles running into ground?		☐ Yes	☑ No
iii) Light poles, electric devices with no overhead lines?		☐ Yes	☑ No
iv) Overhead electric lines present? Marked? (See Section L)		☐ Yes	☑ No
C) Evidence of sewer drains:	Green		
i) Restrooms or kitchen on site?		☐ Yes	☑ No
ii) Sewer cleanouts present?		☐ Yes	☑ No
iii) Combined sewer /storm lines or multiple sewer lines?		☐ Yes	☑ No
D) Evidence of water lines:	Blue		
i) Water meter on site or multiple water lines?		☐ Yes	☑ No
ii) Fire hydrants in vicinity of work?		☐ Yes	☑ No
iii) Irrigation systems? (Sprinkler heads, valve boxes, controls in building)		☐ Yes	☑ No
E) Evidence of storm drains:	Green		
i) Open curbside or slotted grate storm drains		☐ Yes	☑ No
ii) Gutter down spouts going into ground		☐ Yes	☑ No
F) Evidence of telecommunication lines:	Orange		
i) Fiber optic warning signs in areas?		☐ Yes	☑ No
ii) Aboveground cable boxes or housings or wires in work area? Marked?		☐ Yes	☑ No
G) Underground storage tanks:			
i) Tank pit present, tank vent present?		☐ Yes	☑ No
ii) Product lines running to dispensers/buildings?		☐ Yes	☑ No
H) Do utilities enter or exit existing structures/buildings?			
If Yes, confirm the utility markings outside of structure/building match up.		☐ Yes	☑ No
I) Proposed excavation marked in white?	White	☐ Yes	☑ No
J) Unclassed utilities / anomalies marked in pink?	Pink	☐ Yes	☑ No
K) **Overhead** Utilities/Communication Lines - **Look Up and MARK**:			
i) Overhead electrical conduit, pipe chases, cable trays, product lines?		☐ Yes	☑ No
ii) Overhead fire sprinkler system?		☐ Yes	☑ No
L) **Overhead** Power lines in or near the work area:			
i) < 50 kV within 10 ft. of work area?		☐ Yes	☑ No
ii) >50 - 200 kV within 15 ft. of work area?		☐ Yes	☑ No
iii) >200-350 kV within 20 ft. of work area?		☐ Yes	☑ No
iv) >350-500 kV within 25 ft. of work area?		☐ Yes	☑ No
v) >500-750 kV within 35 ft. or work area?		☐ Yes	☑ No
vi) >750-1000 kV within 45 ft. of work area?		☐ Yes	☑ No
M) Other:			
i) Evidence of linear asphalt or concrete repair?		☐ Yes	☑ No
ii) Evidence of linear ground subsidence or change in vegetation?		☐ Yes	☑ No
iii) Unmarked manholes or valve covers in work area?		☐ Yes	☑ No
iv) Warning signs (Call Before you Dig, Look Up, etc.) on or adjacent to site?		☐ Yes	☑ No
v) Utility color markings not illustrated in this checklist?	i.e. Purple	☐ Yes	☑ No
vii) Operating heavy equipment on unpaved/unimproved ground; review equipment route for shallow utilities crossing it and modify if necessary.		☐ Yes	☑ No
O) Utilities & Structures Checklist been reviewed by the PM or Designee		(Yes)	No*
PM or Designee Name: Bob Campion		* If no, STOP WORK, call PM	

Name and Signature of person completing the checklist: Bob Campion

Date: 4-18-22

Do not perform mechanized intrusive work within 30 inches of a utility marking without receiving pre-approval by Corporate H&S.

ALL UTILITY STRIKES REQUIRE CORPORATE H&S NOTIFICATION (EMAIL OR CALL) WITH A CONFIRMED RESPONSE

Comments:

Signature and Certification: I have read and understand the project specific HASP for this project.

Printed Name/Signature/Company	Sign In Time	Sign Out Time
Bob Campion/Bob Cam/Arcadis	1000	1700
Mark Wilson/[illegible]/Arcadis	1100	1700
Anthony Conway/[illegible]/Bennett Well	1100	1700

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK;** and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call **WorkCare at 1.800.455.6155** and then notify the field supervisor.

Utility strike, motor vehicle accident or 3rd party property damage - field supervisor will immediately notify the Project or Task Manager

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JSAs, and other control processes. Discuss and document any additional control processes.

Printed Name/Signature/Company	Sign In Time	Sign Out Time
Bob Campion/Bob Cam/Arcadis	0700	1630
Marcellis LeGrand/[illegible]/PWI	0700	1630
Anthony Convery PWI	0700	1630

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call **WorkCare at 1.800.455.6155** and then notify the field supervisor.

Utility strike, motor vehicle accident or 3rd party property damage - field supervisor will immediately notify the Project or Task Manager

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JSAs, and other control processes. Discuss and document any additional control processes.

TAILGATE HEALTH & SAFETY MEETING FORM

Project Name: USAEC PFAS PA/SI Program

Project Location: Radford VA

Date: 4-20-22 **Time:** 0730 **Conducted by:** Bob Campion

Signature/Title: Bob Cam / AFS Tech 2

Issues or concerns from previous day's activities:

Initial Site Walk Comments:

Task anticipated to be performed today:

☐ Additional permits/checklists attached GWM, GWS, well abandonment

USE TRACK! Evaluate the hazards (h) for the tasks being performed today and rank as Low (L), Medium (M) or High (H). Use relevant JSAs, FHSHB, permit or other work standard to communicate controls (c) to be used to eliminate or mitigate identified hazards.

☒ Gravity (i.e., ladder, scaffold, trips) (L (M) H)
h: uneven surfaces
c: 3 pts. contact

☒ Motion (i.e., traffic, moving water) (L (M) H)
h: Traffic on/off site
c: Cones, tape, truck, hi-vis vest

☒ Mechanical (i.e., augers, motors) (L M (H))
h: Drill rig
c: distance

☒ Electrical (i.e., utilities, lightning) (L (M) H)
h: Overhead pwr lines
c: distance

☒ Pressure (i.e., gas cyl., wells) (L (M) H)
h: caps possibly under pressure
c: distance, out of LOF

☒ Environment (i.e., heat, cold, ice) (L M (H))
h: Heat
c: Hydration/Breaks

☒ Chemical (i.e., fuel, acid, paint) (L (M) H)
h: benzene vapor in wells
c: distance, upwind

☒ Biological (i.e., ticks, poison ivy) (L (M) H)
h: Insects
c: OFF spray/DEET

☒ Radiation (i.e., alpha, sun, laser) (L (M) H)
h: Direct Sun
c: SPF 50-multiple applications

☒ Sound (i.e., machinery) (L (M) H)
h: running motors, vehicles
c: distance, hearing protection

☐ Personal (i.e. alone, night) (L M H)
h:
c: NA

☒ Driving (i.e. car, ATV, boat, dozer) (L (M) H)
h: Traffic
c: Smith Driving

☐ Refer to the attached Hazard Analysis Sheet(s) or JSA

USACE PFAS PA/SI Field Sampling Procedure/Checklist

Installation Name: OFS1 & OFS2			
Field Sampling Dates: 4-19-22, 4-20-22			
install date / sampling date	Description	Step Completed (Explain No Answers Or Deviations In Comments Below)	Completed By Name/ Date
Arcadis Field Coordinator: Kevin Tatu	Arcadis Regional Lead: Jason Artrip		
Arcadis Field Sampling Lead: Bob Campion			
General			
Prior to departing site, review sampling scope and figures in QAPP Addendum to confirm that all planned samples, including field QC samples, were collected, and that sample collection locations are documented and have been marked out with stakes for survey (if necessary).		☒ Yes ☐ No	BC 4-20-22
Verify that any changes/exceptions to the sampling scope are documented and were reported in accordance with requirements (e.g. communication to RL for Corrective Action Report).		☒ Yes ☐ No	
Review all project documentation to verify that all required forms have been filled out completely and no information is missing.		☒ Yes ☐ No	
Verify that any required field monitoring was performed, and results are documented.		☒ Yes ☐ No	
Verify that IDW characterization samples have been collected in accordance with QAPP Addendum		☒ Yes ☐ No	
Verify that meteorological data was recorded for each day of field activities.		☒ Yes ☐ No	
Notify installation point-of-contact that work has been completed and provide post-sampling debrief as necessary.		☒ Yes ☐ No	
Arcadis Field Team Lead completes post-activity inspection to confirm that sampling locations are left clean prior to demobilization. Document that inspection was completed and observations in field notes and take photos for documentation if possible.		☒ Yes ☐ No	
Complete/close out any permits, and return any passes or similar documentation obtained from the installation to perform field work.		☒ Yes ☐ No	
Return rented field equipment and receive confirmation of return.		☒ Yes ☐ No	

USACE PFAS PA/SI Field Sampling Procedure/Checklist

Installation Name:		
Field Sampling Dates:		
Description	**Step Completed** (Explain No Answers Or Deviations In Comments Below)	**Completed By Name/ Date**
Sample Packing and Shipping		
Schedule lab sample courier or FedEx pickup if applicable.	☐ Yes ☐ No	N/A
Perform final check to confirm that correct amount/types of QC samples have been collected prior to shipping.	☑ Yes ☐ No	
If IDW characterization samples are to be collected, verify that these are included in sample shipment and are listed on COC.	☑ Yes ☐ No	
Complete laboratory COC to include with sample shipment. If shipping samples via FedEx, place COC inside sealed Ziploc polyethylene bag inside cooler. See SOPs P01 and P02 in PQAPP Appendix A for additional details on shipping documentation and COCs.	☑ Yes ☐ No	
Pack sample coolers for shipment to laboratory. - Check that sample bottles are packed securely in coolers with sufficient packing material present to avoid breakage during transport. - Add fresh ice to sample coolers to maintain the temperature between 0 and 6°C (when in doubt, overdo it on the ice, especially during summer months). Place ice in sealed Ziplock polyethylene bags. NO blue ice. - Seal cooler with packing tape and attach custody seals.	☑ Yes ☐ No	
If shipping samples via FedEx, send priority overnight delivery. Verify that lab is accepting samples on Saturday/holiday before shipping for Saturday/holiday delivery. Be sure to request morning delivery if shipping for Saturday delivery.	☑ Yes ☐ No	
Contact laboratory PM to notify them of sample shipment. If shipping samples FedEx provide laboratory PM with tracking number on airbill. Request that laboratory PM send confirmation email to project team when samples arrive.	☑ Yes ☐ No	

USACE PFAS PA/SI Field Sampling Procedure/Checklist

Installation Name:		
Field Sampling Dates:		
Description	**Step Completed** (Explain No Answers Or Deviations In Comments Below)	**Completed By Name/ Date**
Waste Management		
All media (soil, sediment, groundwater, surface water), decontamination fluids, and dedicated/disposable equipment/PPE that has contacted or is suspected to have contacted contaminated media shall be managed as IDW. Follow IDW management requirements provided in the installation-specific QAPP Addendum, and in P08 TGI - Investigation Derived Waste Handling and Storage in PQAPP Appendix A.	☑ Yes ☐ No	
All IDW will be containerized in 55-gallon drums by waste-stream and transported to a pre-designated staging area at the installation. 5gal bucket w/ lid to Andy Wirt	☐ Yes ☐ No	
Soil and groundwater IDW from areas where high concentrations of PFAS related to class B Firefighting foams are suspected should not be combined in the same drums with IDW from other areas where lower concentrations of PFOS/PFOA are suspected to the extent possible. Consult with RL to determine plan for drumming soils and GW that will minimize potential for mixing of IDW with high and low PFAS concentrations.	☑ Yes ☐ No	
All containers must be labeled at the time of collection. Labels will include date, location(s), site name, city, state, and description of matrix contained (e.g., soil, groundwater, PPE). See P08 TGI - Investigation Derived Waste Handling and Storage in PQAPP Appendix A. Keep a tally of the number of drums generated for each IDW stream in field notes.	☑ Yes ☐ No	
Non-IDW wastes will be removed from the site immediately upon completion of each day's field activities and disposed as regular trash.	☑ Yes ☐ No	
All rinsate from field/equipment blanks and equipment decontamination should be collected in a sealed pail for disposal during the course of sampling, and transferred into a ~~55-gallon~~ 5gal bucket drum at the end of each day.	☑ Yes ☐ No	
Unless otherwise specified, collect waste characterization samples for laboratory analysis from IDW streams generated during field sampling work prior to demobilizing from the site. Waste characterization sampling details will be provided in the installation-specific QAPP Addendum. Waste characterization samples will be sent to the laboratory for analysis with the other field samples.	☑ Yes ☐ No	

USACE PFAS PA/SI Field Sampling Procedure/Checklist

Installation Name:		
Field Sampling Dates:		
Description	**Step Completed** (Explain No Answers Or Deviations In Comments Below)	**Completed By Name/ Date**
Project Documentation/Field Reporting		
Arcadis Field Team Lead completes field progress report and send by email to Arcadis RL for review at the end of each working day.	☑ Yes ☐ No	
Upon returning from the field, the Arcadis Field Team Lead will assemble all field documentation scan to PDF and provide Arcadis RL with electronic and hard copies. Field documentation should include: - Field notes (this should include an inventory of all IDW drums generated during field work) - Sample/purge logs - Tailgate safety meeting logs, TIPs and other health and safety paperwork specified in AAP - Boring logs - Field equipment calibration logs - Laboratory COCs and FedEx airbills - Packing list for rental field equipment shipments (identifying make/model of field equipment) - Photo logs (if applicable)	☑ Yes ☐ No

USACE PFAS PA/SI Field Sampling Checklist - Groundwater

Installation: 4-19-22	Sampling Dates: 4-20-22		
Item	**Description** *see Read File for details	**Item Completed** (Explain deviations in comments below)	**Completed By Name/ Date**
Arcadis Region Lead: Kevin Toth	Field Team Lead: Bob Campion		
General			
1	Following General Field Sampling Requirements-Field Gear/PPE, Personal Hygiene, and Other to minimize cross-contamination. Key to wash hands thoroughly and change gloves frequently. *	☒ Yes ☐ No	BC
2	Field notes on non-waterproof materials. Keep writing implements away from samples. *	☒ Yes ☐ No	
3	If wet weather occurs, following Rain Event requirements. *	☒ Yes ☐ No	
4	Analyzed drilling/decon water source prior to start drilling if not already confirmed PFAS-free. *	☒ Yes ☐ No	
5	Inspecting all drilling/GW sampling equipment that will/could come into direct contact with soil/groundwater samples to confirm that it is deconned/PFAS-free per Sampling Equipment List in Read File. Contact RL or field/lab coordinator with any concerns. *	☒ Yes ☐ No	
6	Placing LDPE sheeting on sampling work surface and/or preventing sampling equipment from contacting the ground or other surface that could compromise sample integrity. Do not allow vehicle exhaust to point towards the sample point.	☒ Yes ☐ No	
7	Donning new pair of nitrile gloves, at a minimum, before the following activities: * - Decontamination of re-usable sampling equipment - Contact with sample bottles or PFAS-free water bottles - Handling clean sample tubing/down-well equipment or connecting tubing. - Handling QC samples including field blanks and equipment blanks. Don a new pair of nitrile gloves, at a minimum, after the following activities: * - Handling of any non-dedicated sampling equipment - Contact with contaminated surfaces - Whenever judged necessary by field personnel	☒ Yes ☐ No	
Monitoring Well Installation in scope			
8	Performing work in accordance with P-12 - PFAS-Specific Drilling and Monitoring Well Installation TGI in PQAPP Appendix A	☒ Yes ☐ No	
9	Recording list of well completion materials used for each well in field notes: number bags of sand, bentonite, cement, including material types and brand names.	☒ Yes ☐ No	
VAP Groundwater Sampling in scope			
10	Performing work in accordance with P-14 - Vertical Aquifer Profiling for PFAS Analysis TGI in PQAPP Appendix A	☒ Yes ☐ No	
11	Purging until water is visually clear of sediment, or for 20 minutes max before collecting samples.	☒ Yes ☐ No	
Low-Flow Sampling of Monitoring Wells			
12	Performing work in accordance with P-11 - PFAS Sampling Procedures and Low-Flow Groundwater Purging for Monitoring Wells TGI in PQAPP Appendix A	☒ Yes ☐ No	
13	If existing equipment is present in monitoring well (e.g., bailer, pump, sorbent sock) contacting Arcadis RL to discuss how to proceed with sampling.	☐ Yes ☐ No	N/A
14	Using two field personnel to insert tubing/pump into well to avoid contact with ground surface or other materials that could cause cross-contamination. Keeping equipment at least 2 feet above bottom of the well to avoid mobilizing sediment present in well.	☒ Yes ☐ No	
Groundwater Sample Collection/Management			
15	Keeping cap on bottle until immediately prior to sample collection/placing cap back on bottle immediately after sample collection. Not placing cap on any surface, keeping cap in hand opposite of that used for sample collection, not touching inside of the cap.	☒ Yes ☐ No	
16	Placing label on sample bottles after sample is collected and cap has been replaced.	☒ Yes ☐ No	
17	Are high concentrations of PFOS/PFOA related to class B Firefighting foams expected in sample (specified in QAPP Addendum)? If so, perform shake test on portion of the sample (~10-25 mL) as set forth in the TGI - Poly- and Perfluorinated Alkyl Substances (PFAS) Field Sampling Guidance in the PQAPP. If foaming is observed, document foaming on the sample log and COC for laboratory personnel.	☒ Yes ☐ No	
18	Adding fresh ice to sample coolers at beginning and end of each day, or as otherwise needed. **NO blue ice.**	☒ Yes ☐ No

APPENDIX K

Field Change Reports

Appendix K
Field Change Report
U.S. Army Environmental Command
Per- and Polyfluoroalkyl Substances Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Installation Name:	Radford Army Ammunition Plant	Event Date:	08 December 2020
Contract No:	3W912DR-18-D-0004	Prepared By:	L. Henderson
Project/Task No:	30001992.3DN10	Applicable Document:	Quality Assurance Project Plan Addendum: Worksheet #18 and associated figure(s)
Field Change Report No:	FCR-RFAAP-01		

1. Description

A groundwater sample (RFAAP-RW-GW-1) was added at the River Warehouse AOPI (figure attached).

2. Reason for Change

In October 2020, USAEC requested further review of karst installations and associated groundwater sampling. Arcadis karst experts (separate from the project team) reviewed the RFAAP scope and determined the scope was sufficient at all sites except the River Warehouse. They recommended addition of one groundwater sample since only soil sampling was previously scoped for this site in the QAPP Addendum. The groundwater sample was added to the most downgradient soil sample location for a co-located groundwater/soil boring. The groundwater sample was be collected via DPT drilling.

3. Impact on Present and Completed Work

The scope of work is expanded; however, this one additional DPT point will fit into the budget of the original awarded scope. No additional funding is necessary.

4. Remarks

A revision to the Final QAPP Addendum dated August 2020 is not planned. This change is documented via this field change report and will be reported in the PA/SI report.

Appendix K
Field Change Report
U.S. Army Environmental Command
Per- and Polyfluoroalkyl Substances Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Installation Name:	Radford Army Ammunition Plant	Event Date:	05 January 2021
Contract No:	3W912DR-18-D-0004	Prepared By:	K. Toth
Project/Task No:	30001992.3DN10	Applicable Document:	Quality Assurance Project Plan Addendum: Worksheet #18 and associated figure(s)
Field Change Report No:	FCR-RFAAP-02		

1. Description

One planned surface water sample (RFAAP-CFS-SW-1) was not collected at the Current Fire Station AOPI.

2. Reason for Change

No water was present at this sample location at the time of the site inspection field event.

3. Impact on Present and Completed Work

No anticipated impact on the overall scope of project work. Per discussion, this sample was suspected to be potentially unavailable due to the amount of rain the installation would receive around the time of the sampling event. Soil samples from this AOPI and surface water from proximal AOPIs provided sufficient data to determine presence or absence of PFOS, PFOA, and/or PFBS at the Current Fire Station AOPI.

4. Remarks

No remarks.

Appendix K
Field Change Report
U.S. Army Environmental Command
Per- and Polyfluoroalkyl Substances Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Installation Name:	Radford Army Ammunition Plant	Event Date:	05 January 2021
Contract No:	3W912DR-18-D-0004	Prepared By:	K. Toth
Project/Task No:	30001992.3DN10	Applicable Document:	Quality Assurance Project Plan Addendum: Worksheet #18 and associated figure(s)
Field Change Report No:	FCR-RFAAP-03		

1. Description

One planned groundwater sample (RFAAP-TEF-GW-2) was not collected at the Teflon Coating Facility AOPI.

2. Reason for Change

Refusal occurred during drilling before groundwater was encountered at the RFAAP-TEF-GW-2 sample location during the site inspection field event.

3. Impact on Present and Completed Work

No anticipated impact on the overall scope of project work. Groundwater was sampled at two other proximal locations at the Teflon Coating Facility AOPI. These two other samples are sufficient to determine the presence or absence of PFOS, PFOA, and/or PFBS at the Teflon Coating Facility AOPI.

4. Remarks

No remarks.

Appendix K
Field Change Report
U.S. Army Environmental Command
Per- and Polyfluoroalkyl Substances Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Installation Name:	Radford Army Ammunition Plant	Event Date:	05 January 2021
Contract No:	3W912DR-18-D-0004	Prepared By:	K. Toth
Project/Task No:	30001992.3DN10	Applicable Document:	Quality Assurance Project Plan Addendum: Worksheet #18 and associated figure(s)
Field Change Report No:	FCR-RFAAP-04		

1. Description

QA/QC samples (field duplicate, matrix spike, and matrix spike duplicate) proposed at the groundwater sample location RFAAP-TEF-GW-1 within the Teflon-Coating Facility AOPI were instead collected at the groundwater sample location RFAAP-31MW1 within the Old Fire Station 2 AOPI. QA/QC samples (matrix spike and matrix spike duplicate) proposed at the soil sample location RFAAP-OFS1-SO-1 within the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI were instead collected at the soil sampling location RFAAP-OFS1-SO-2 within the same AOPI.

2. Reason for Change

The groundwater QA/QC samples were not collected at the Teflon-Coating Facility because there was not enough water in the proposed boring at the time of the sampling event. The soil QA/QC samples were not collected at the RFAAP-OFS1-SO-1 sampling location due to the hand auger meeting refusal earlier than expected.

3. Impact on Present and Completed Work

No anticipated impact on the overall scope of project work.

4. Remarks

Groundwater samples from borings at the Teflon-Coating Facility AOPI demonstrated slow recharge rates.

Appendix K
Field Change Report
U.S. Army Environmental Command
Per- and Polyfluoroalkyl Substances Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Installation Name:	Radford Army Ammunition Plant	Event Date:	15 April 2021
Contract No:	3W912DR-18-D-0004	Prepared By:	K. Toth
Project/Task No:	30001992.3DN10	Applicable Document:	Quality Assurance Project Plan Addendum: Worksheet #18 and associated figure(s)
Field Change Report No:	FCR-RFAAP-05		

1. Description

One surface water location (RFAAP-OFS1-SW-1) at the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI was moved to a different location and collected in April 2021.

2. Reason for Change

There was no water present at the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI during the January site inspection field event. Therefore, staff returned to site and collected the sample (RFAAP-OFS1-SW-1) from a proximal surface water body.

3. Impact on Present and Completed Work

No anticipated impact on the overall scope of project work.

4. Remarks

No remarks.

Field Change Report
U.S. Army Environmental Command
Per- and Polyfluoroalkyl Substances Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Installation Name:	Radford Army Ammunition Plant	Event Date:	TBD
Contract No:	3W912DR-18-D-0004	Prepared By:	K. Toth
Project/Task No:	30001992.3DN10	Applicable Document:	Quality Assurance Project Plan Addendum: Worksheet #18 and associated figure(s)
Field Change Report No:	FCR-RFAAP-06		

1. Description

An additional site inspection (SI) sampling event (Phase II) will be conducted at Radford Army Ammunition Plant (RFAAP) to determine presence or absence of perfluorooctane sulfonate (PFOS), perfluorooctanoic acid (PFOA), and perfluorobutanesulfonic acid (PFBS) in groundwater at AOPIs where groundwater was either not sampled or was not sufficient to determine said presence or absence.

Figure FCR-1 shows the proposed groundwater sampling locations at the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI. **Figure FCR-2** shows the proposed groundwater sampling locations at the Old Fire Station 2 AOPI.

This sampling scope is as agreed upon by United States Army Environmental Command (USAEC), United States Army Corps of Engineers (USACE), and RFAAP during a scoping teleconference conducted on 02 January 2020. Utility clearance and any relevant installation permits will be obtained prior to any intrusive work at the proposed drilling locations.

2. Reason for Change

Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI

No existing monitoring wells are located near this AOPI, and groundwater sampling was not included in the initial SI sampling event (Phase I). Records research, personnel interviews, and site reconnaissance indicate storage of fire trucks containing aqueous film-forming foam (AFFF) or storage of AFFF occurred at this location. In the previous SI sampling event, soil samples were collected in the center of the building footprint for the Old Fire Station 1, which has been demolished, and within the surface runoff flow direction of each building footprint. A spring surface water sample was collected in the downgradient groundwater flow direction from the AOPI.

Additional groundwater sampling at the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI is proposed to include one temporary well on the downgradient (north-northeastern) side of the Old Fire Station 1, which will be drilled using either DPT (direct push technology) or sonic technology. The sonic method will be employed if using the same rig for both AOPIs is more cost efficient than having different types of rigs for each AOPI. The bore hole will be drilled to first-encountered water, and although the water table is not well understood, groundwater elevation is estimated to be approximately 30 ft bgs (feet below ground surface) and most likely occurs in the unconsolidated material overlying bedrock. This location will assess the presence or absence of PFOS, PFOA, and/or PFBS in groundwater associated with a release of PFAS-containing materials (AFFF) to the ground surface at the station.

Old Fire Station 2 AOPI

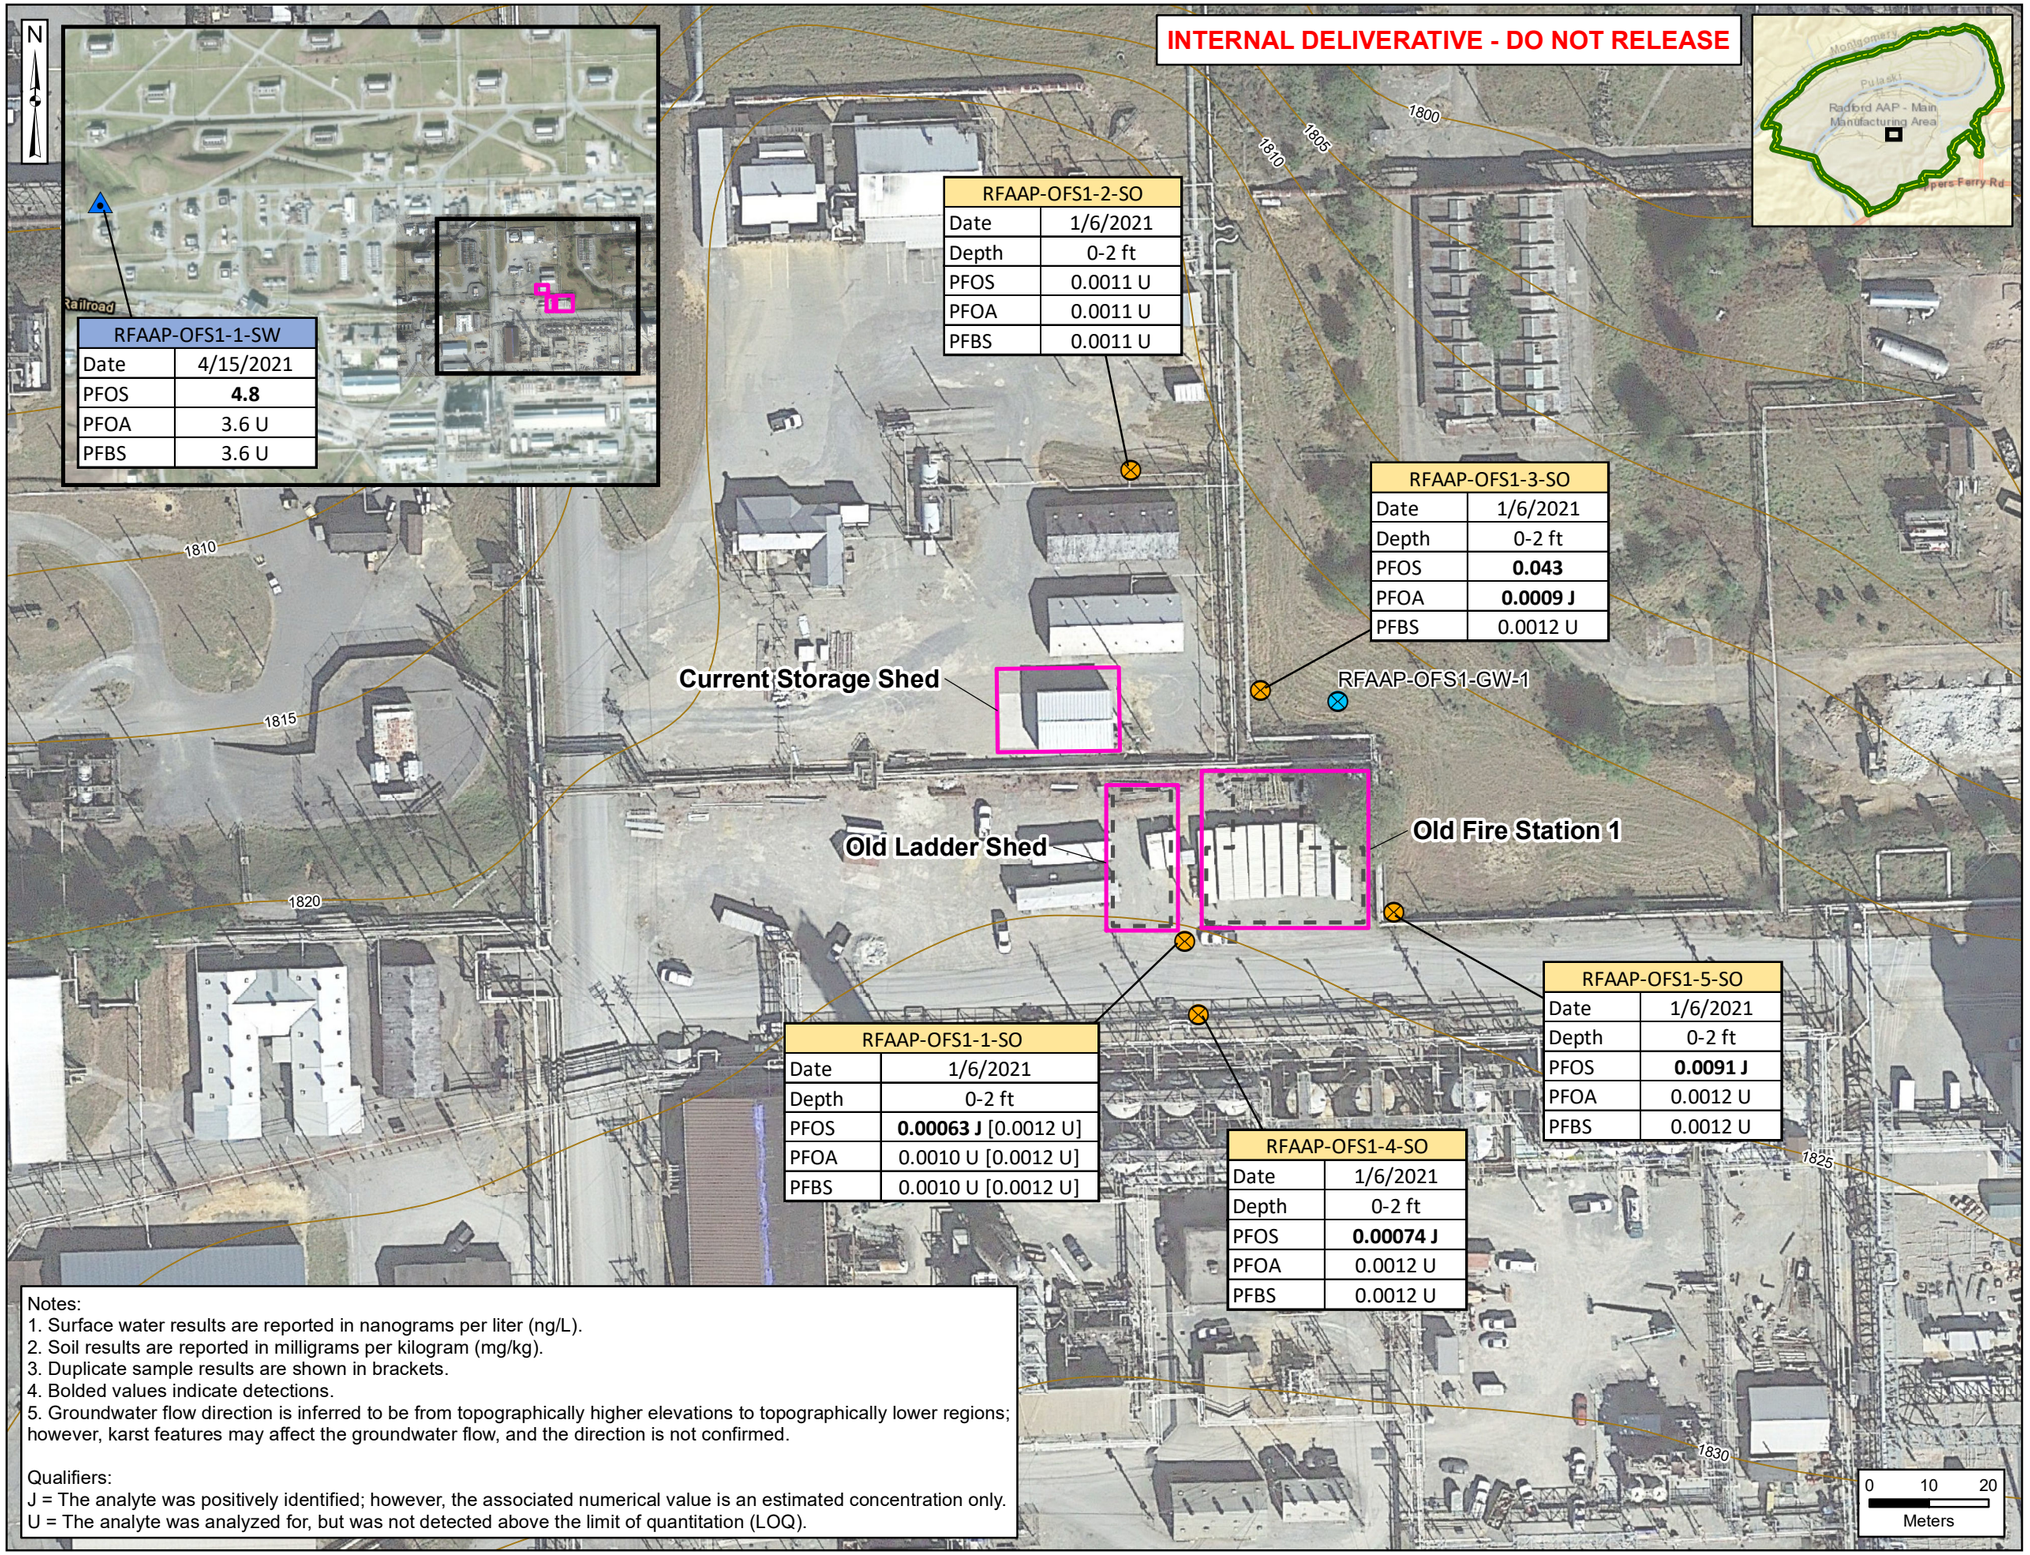
One existing monitoring well (31MW1) is located potentially downgradient of this AOPI but it was determined a more proximal sample was necessary. Groundwater sampling was included in the initial SI sampling event (Phase I) as sample RFAAP-31MW1. Records research, personnel interviews, and site reconnaissance indicate potential nozzle testing or flushing occurred at this area. In the previous SI sampling event, soil samples were collected within the potential nozzle testing or flushing areas and in the surface runoff flow areas.

Additional groundwater sampling at the Old Fire Station 2 AOPI is proposed to include one temporary well on the downgradient (southwestern) side of the Old Fire Station 2, which will be drilled using sonic technology. The bore hole will be drilled to first-encountered water, and although the water table is not well understood, groundwater elevation is estimated to be approximately 150 ft bgs and most likely occurs in the bedrock. This location will assess the presence or absence of PFOS, PFOA, and/or PFBS in groundwater associated with a release of PFAS-containing materials (AFFF) to the ground surface at the station.

3. Impact on Present and Completed Work

No anticipated impact on the overall scope of project work. The additional data collected at the Current Fire Department Station will be included in the Preliminary Assessment/Site Inspection (PA/SI) report addendum.

4. Remarks



Additional groundwater sampling at the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI is proposed to include one temporary well on the downgradient (north-northeastern) side of the Old Fire Station 1, which will be using sonic. This location will assess the presence or absence of PFOS, PFOA, and/or PFBS in groundwater associated with a release of PFAS-containing materials (AFFF) to the ground surface at the station.

The Project/Data Quality Objectives (Worksheet #11), Sampling Design and Rationale (Worksheet #17), sampling methods within Worksheet #18, Field Quality Control Summary (Worksheet #20), Field Standard Operating Procedures (Worksheet #21), and Field Equipment Calibration, Maintenance, Testing, and Inspection (Worksheet #22) as outlined in the RFAAP Final QAPP Addendum (Arcadis 2020) remain in place for the contents laid out in this field change report. Additionally, investigation-derived waste generated during this scope of work will be handled as laid out in the RFAAP Final QAPP Addendum. The preliminary conceptual site models for the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed and Old Fire Station 2 AOPIs will be updated and included in the PA/SI Report deliverable as needed.

1 INTRODUCTION

This document describes general and/or specific procedures, methods, actions, steps, and considerations to be used and observed by Arcadis staff when performing work, tasks, or actions under the scope and relevancy of this document. This document may describe expectations, requirements, guidance, recommendations, and/or instructions pertinent to the service, work task, or activity it covers.

It is the responsibility of the Arcadis Certified Project Manager (CPM) to provide this document to the persons conducting services that fall under the scope and purpose of this procedure, instruction, and/or guidance. The Arcadis CPM will also ensure that the persons conducting the work falling under this document are appropriately trained and familiar with its content. The persons conducting the work under this document are required to meet the minimum competency requirements outlined herein, and inquire to the CPM regarding any questions, misunderstanding, or discrepancy related to the work under this document.

This document is not considered to be all inclusive nor does it apply to any and all projects. It is the CPM's responsibility to determine the proper scope and personnel required for each project. There may be project- and/or client- and/or state-specific requirements that may be more or less stringent than what is described herein. The CPM is responsible for informing Arcadis and/or Subcontractor personnel of omissions and/or deviations from this document that may be required for the project. In turn, project staff are required to inform the CPM if or when there is a deviation or omission from work performed as compared to what is described herein.

In following this document to execute the scope of work for a project, it may be necessary for staff to make professional judgment decisions to meet the project's scope of work based upon site conditions, staffing expertise, state-specific requirements, health and safety concerns, etc. Staff are required to consult with the CPM when or if a deviation or omission from this document is required that has not already been previously approved by the CPM. Upon approval by the CPM, the staff can perform the deviation or omission as confirmed by the CPM.

2 SCOPE AND APPLICATION

This Technical Guidance Instruction (TGI) describes methods for the following at sites impacted by per- and polyfluoroalkyl substances (PFASs):

- Advance soil borings via direct push technology (DPT), rotosonic, hollow stem auger, or air rotary drilling techniques
- Collect single or multiple depth-discrete dry and/or saturated soil samples
- Collect single-interval grab groundwater samples
- Install groundwater monitoring wells in unconsolidated aquifers (as necessary).

This TGI covers specific considerations relevant for PFASs due to their unique chemical and physical properties, low detection limits, and low regulatory standards. A more detailed discussion of general PFAS sampling procedures is provided in PFAS Field Sampling Guidance TGI (Arcadis 2018a).

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

If monitoring wells are to be installed upon completion of borehole drilling and soil sampling, it is assumed that the monitoring well has been designed consistent with the approach and methods presented in the American Society of Testing and Materials (ASTM) D5092 – *Standard Practice for Design and Installation of Groundwater Monitoring Wells* (ASTM D5092). This includes sizing of the filter pack and screen slot size, the length of the screen, total depth of the well, material strength and compatibility and surface completion. Typical monitoring wells are constructed of manufactured screen and engineered filter pack and are generally suitable for formations with granular materials having a grain size distribution with up to 50% passing a #200 sieve and up to 20% clay-sized material. Monitoring wells installed in formations finer than this may not be able to produce turbidity free water.

The procedures set out herein are designed to produce standard groundwater monitoring wells suitable for: (1) groundwater sampling; (2) water level measurement; and (3) hydraulic conductivity testing of formation sediments immediately adjacent to the open interval of the well (e.g., slug testing).

This TGI will focus specifically on four drilling methods most likely to be utilized during drilling and soil sampling activities: DPT, rotosonic, hollow stem auger, and air rotary techniques. The drilling method to be used at a given site will be selected based on site-specific consideration of anticipated drilling depths, site or regional geologic knowledge, type of sampling to be conducted, project objectives, and cost.

No oils or grease will be used on equipment introduced into the boring (e.g., drill rod, casing, or sampling tools). No polyvinyl chloride (PVC) glue/cement will be used in constructing or retrofitting monitoring wells that will be used for water-quality monitoring. No coated bentonite pellets will be used in the well drilling or construction process. Specifications of materials to be installed in the borehole will be obtained prior to mobilizing onsite; these materials generally include:

- Well casing (length, material, and diameter);
- Well screen (length, material, diameter, and slot size);
- Bentonite (type, as applicable, chips, non-coated and granular bentonite are acceptable);
- Filter pack (filter pack type and fine sand seal type, as applicable); and
- Grout (type, as applicable).

Well materials will be inspected and, if needed, cleaned or replaced prior to installation.

3 PERSONNEL QUALIFICATIONS

Drilling and soil sampling activities will be performed by persons who have been trained in proper procedures under the guidance of an experienced field geologist, engineer, or technician, with particular emphasis on PFAS sampling procedures outlined in PFAS Field Sampling Guidance TGI (Arcadis 2018a). Field personnel will have undergone in-field training in soil description methods, as described in Soil Description TGI (Arcadis 2018b).

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

4 EQUIPMENT LIST

The following equipment and materials must be available for borehole advancement, single-interval groundwater sampling, and well construction activities:

- Site plan with proposed sampling locations;
- Relevant work plan (e.g., installation-specific Quality Assurance Project Plan [QAPP] Addendum);
- Site Safety and Health Plan (SSHP);
- Appropriate health and safety equipment, as specified in the SSHP;
- Drilling Equipment:
    - DPT, rotosonic, hollow stem auger, or air rotary drill rig, to be provided by drilling subcontractor. Type to be determined based on site-specific details.
    - Direct push groundwater samplers (e.g., Geoprobe® SP-22 or Geoprobe® SP-16) rotosonic sampling devices (e.g., Cascade Packer Isolation Groundwater Profiler or Geoprobe® SP-60 Sonic Groundwater Sampler), or hollow stem auger/air rotary sampling devices (e.g., pre-packed PVC well screens and PVC riser), to be provided by drilling subcontractor.
    - Traffic cones, delineators, caution tape, and/or fencing as appropriate for securing the work area, if not provided by the drillers.
    - Note: Prior to mobilizing to the site, Arcadis personnel will contact the drilling subcontractor or in-house driller (as appropriate) to confirm that appropriate sampling equipment will be provided in quantities capable of achieving estimated target depths. Specifications of the sampling and well installation equipment are expected to vary by project, so communication with the driller is necessary to ensure that the materials provided will meet the project objectives. Equipment and materials typically provided by the driller could include:
        - Disposable acetate (or Lexan TM) liners (when drilling with direct-push equipment)
        - Appropriate length of drilling rods and tooling
        - Drilling and sampling equipment decontamination materials
        - Decontamination pad materials
        - Well construction materials
        - Drums for investigation derived waste
- Sampling:
    - Appropriate PFAS-free groundwater sampling equipment (e.g., disposable bailers for volumetric sampling, peristaltic pump for shallow groundwater sampling, submersible bladder pump for deeper sampling). Refer to the PFAS Field Sampling Guidance TGI (Arcadis 2018a) and Low-Flow Groundwater Purging and Sampling Procedures for Monitoring Wells TGI (Arcadis 2016) for necessary equipment.
    - Stainless-steel spatulas, spoons, and trowels.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

- Stainless-steel hand auger with at least 10-ft of extension rods.
- PVC piping of larger diameter than hand auger, if necessary, to keep hand auger borings open.
- Soil logging equipment as specified in the appropriate project documents.
- Dedicated low-density polyethylene (LDPE) plastic sheeting to prevent sample contact with the ground.
- Photoionization detector (PID) or flame ionization detector (FID) with calibration gas.
- 4-gas meter with calibration gas.
- Water level meter with fluorine-free materials (Geotech ET 3/8" with Delrin tip and Buna-N O-ring).
- YSI 6-Series multi-parameter water quality probe or equivalent (e.g., conductivity, temperature, dissolved oxygen, oxidation reduction potential) with flow-through cell.
- Turbidity meter.
- Laboratory provided PFAS-free water for field and equipment blank QC samples.
- Laboratory-provided HPDE PFAS shaker test vials.
- Appropriate sample containers and labels:
  - Laboratory-supplied HDPE sample bottles: see the Poly- and Perfluorinated Alkyl Substances (PFAS) Field Sampling Guidance (Arcadis 2018a) for PFAS-specific considerations.
  - Polyethylene bags (Ziploc® brand only) to hold ice and samples.
  - Appropriate blanks (field reagent blanks supplied by the laboratory).
  - Packing and shipping materials.
  - Chain-of-Custody (COC) Forms; see the Sample Chain of Custody Standard Operating Procedure (SOP) for reference (Arcadis 2017a).
  - Appropriate transport containers (coolers) with ice and appropriate labeling; no blue ice.

- Decontamination/Waste Management:
  - PFAS-free decontamination fluids and equipment:
    - HDPE or PVC brushes and squirt bottles
    - Stainless steel bowl
    - HDPE buckets to hold decontamination fluids
    - Alconox or Liquinox (other detergents prohibited)
    - Distilled or laboratory-supplied deionized water
    - Laboratory provided PFAS-free water

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

- See the Poly- and Perfluorinated Alkyl Substances (PFAS) Field Sampling Guidance (Arcadis 2018a) or the Groundwater and Soil Sampling Equipment Decontamination TGI (Arcadis 2017b) for additional guidance.
- Portable field hand washing setup.
- Non-hazardous drum labels as required for investigation-derived waste handling: see the Investigation-Derived Waste Handling and Storage TGI for details (Arcadis 2017c).

- Field Notes:
  - Pens, pencils, and/or Sharpies® for writing
  - Appropriate field forms
  - Clipboards, field binders, field notebook, and field note pages that are not waterproof
  - Digital camera
- Other:
  - Field clothing made of cotton or other natural fibers that is well laundered (i.e., washed at least 6 times)
  - Well laundered cotton blankets for covering field vehicle seats
  - PFAS-free sunscreen and insect repellant
  - Garbage bags
  - Paper towels
- Locks and keys for securing the well after installation
- Engineer's tape/measuring wheel

5 CAUTIONS

5.1 Utility Clearance

The appropriate drilling authorities will be contacted and a site visit for public utility line clearance at the proposed boring locations will be conducted at least 72 hours prior to work commencing. As applicable, utility maps will be reviewed during field reconnaissance of the proposed inspection locations to determine if any are co-located with public utility lines. Arcadis will also contract an independent geophysical survey company to verify that proposed boring locations are not co-located with existing underground utility/substructure features, as necessary. Arcadis will clear locations with soft dig methods to assess the presence of underground utilities as necessary. See the Utility Location and Clearance Arcadis Health and Safety Standard (Arcadis 2017d) for reference.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

5.2 General Drilling and Well Construction Considerations

Prior to beginning field work, contact the project technical team to ensure that all field logistics (e.g., access issues, health and safety issues, communication network, schedules, etc.) and task objectives are clearly understood by all team members.

Some regulatory agencies require a minimum annular space between the well or permanent casing and the borehole wall. When specified, the minimum clearance is typically 2 inches on all sides (e.g., a 2-inch diameter well requires a 6-inch diameter borehole). In addition, some regulatory agencies have specific requirements regarding grout mixtures. Determine whether the oversight agency has any such requirements prior to finalizing the drilling and well installation plan.

If dense non-aqueous phase liquids (DNAPL) are known or expected to exist at the site, refer to the project specific documents for additional details regarding drilling and well installation to reduce the potential for inadvertent DNAPL remobilization.

Similarly, if light non-aqueous phase liquids (LNAPLs) are known or expected to be present as “perched” layers above the water table, refer to the DNAPL Contingency Plan. Follow the general provisions and concepts in the DNAPL contingency plan during drilling above the water table at known or expected LNAPL sites.

Consider the compatibility between the well materials and the surrounding environment. For example, PVC well materials are not preferred when DNAPL is present. In addition, some groundwater conditions leach metals from stainless steel or are corrosive to metal well materials. If questions arise, contact the CPM and/or project technical lead to discuss.

Specifications of materials used for backfilling the borehole will be obtained, reviewed and approved to meet project quality objectives. Bentonite is not recommended where DNAPLs are likely to be present or in groundwater with high salinity. In these situations, neat cement grout is preferred.

As noted above, coated bentonite pellets will not be used in monitoring well construction, as the coating could impact the water quality in the completed well.

Heat of hydration during neat cement grout curing must be considered to avoid damage to PVC well materials. The annular space for a typical monitoring well is small enough that heat of hydration should not create excessive temperature increases which may damage PVC well material. However, washouts in the borehole can lead to thick accumulations of grout which can produce enough heat during curing to weaken and potentially damage PVC casing. If heat of hydration is a concern, contact the project technical lead to address the issue.

5.3 PFAS-Specific General Sampling Considerations

This section provides a summary of methods and procedures applicable to the collection of environmental samples for field screening or laboratory analysis during PFAS site characterization activities. In general, sampling techniques used for PFAS site characterization are consistent with conventional sampling techniques used in the environmental industry, but special consideration is made regarding PFAS-containing materials and cross-contamination potential. For example, Teflon™ and other fluoropolymer containing materials are found in pumps, tubing, and sample storage containers and therefore should be

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

avoided (Department of Environment Regulation [DER], Western Australia 2016; New Hampshire Department of Environmental Services [NHDES] 2016). Certain field documentation materials such as waterproof paper or field books, adhesive paper products, and some writing utensils (grouped as non-Sharpie® markers) are also prohibited items during PFAS sampling (DER 2016; NHDES 2016).

New nitrile gloves should be donned before any of the following activities:

- Decontamination of re-usable sampling equipment;
- Contact with sample bottles or PFAS-free water bottles;
- Handling clean sample tubing/down-well equipment or connecting tubing;
- Handling QC samples including field blanks and equipment blanks.

Additionally, new nitrile gloves should also be donned after handling of any non-dedicated sampling equipment; contact with contaminated surfaces; and whenever judged necessary by field personnel. **When in doubt change your gloves.**

Prior to initiating field activities, water sources to be used during drilling activities (e.g., rotosonic drilling, should be sampled to verify those sources are PFAS-free. While not part of the PQAPP, this is considered best practice and should be completed to the extent possible.

Waterproof field books must not be used for field notes. Instead, field notes should be on loose paper on Masonite, plastic, or aluminum clip boards. Other requirements for field notes include:

- Keep field notes, writing implements, and electronic data collection tablets away from samples and sampling materials; and,
- Do not write on sampling bottles unless they are closed.

Tables 1 and **2** in **Attachment 1** provide recommendations for PFAS Site Inspection equipment. **Table 1** provides a summary of materials that have been approved for site inspection; this list is expected to grow longer as industry experience increases. **Table 2** provides a summary of field equipment and materials that have available testing information and/or industry knowledge regarding PFAS cross-contamination potential and it is recommended that these materials be prohibited for sample collection. For materials that are suspected of containing PFASs and/or retaining PFASs, these recommendations are considered preliminary and subject to change.

Given the extremely low detection limits associated with PFAS analysis and the many potential sources of trace levels of PFASs, field personnel are typically advised to err on the side of caution by strictly following field wear guidelines and decontamination procedures as specified in the Poly- and Perfluorinated Alkyl Substances (PFAS) Field Sampling Guidance (Arcadis 2018a). **The most important consideration during PFAS related drilling and soil sampling is to prevent contact between sample media and suspect PFAS sources.**

5.4 PFAS-Specific Groundwater Sampling

The potential presence of PFASs in equipment that may come in contact with the target water sample must be evaluated as part of the sample planning process to maintain sample integrity. For example, low-flow sampling with a peristaltic pump should be conducted using silicone or HDPE tubing; Teflon™ tubing is prohibited (DER 2016). If a bladder pump is used to collect samples, the bladder and other internal

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

parts (e.g., check balls, o-rings, compression fittings) should not be made of Teflon™ either, and bladder and o-rings should be changed between samples (DER 2016).

Note that if high concentrations of PFASs related to Class B firefighting foams are expected in a groundwater sample, it has been recommended to collect and shake a small portion of the sample at the time of sample collection (USACE 2016; Arcadis 2018a). If foaming is noted within the sample, it indicates elevated concentrations of PFASs may be present and the sample should be proactively diluted at the laboratory prior to analysis. The foaming should be noted on the sample chain of custody form. It is recommended to collect sampling equipment blanks following foam observation to confirm the effectiveness of decontamination procedures.

5.5 PFAS-Specific Soil Sampling

Equipment that contacts soil cuttings during sampling activities should be carefully considered and selected. PFAS-containing materials are potentially present in some of the equipment typically used for soil sampling. This includes any lubricants, connections, fittings, etc. used on the cutting shoe on the head of a direct push drill string. Additionally, no materials that pose a cross-contamination risk should be introduced to the bucket of a hand auger. **To minimize the risk of cross-contamination, all hand augering activities (i.e. augering, sample collection, decontamination) should be performed by Arcadis personnel (as opposed to drilling subcontractor) when surface soil samples will be collected**. Each piece of reusable drilling/sampling equipment that comes into direct contact with soil cuttings or groundwater must be inspected before use to confirm that PFAS-containing materials are not present, which could be a source of cross-contamination and cause false positives, and that PFASs will not adhere to the material, which has the potential to cause low bias sample results. If equipment cannot be verified as being PFAS-free and there is a concern that it could potentially introduce contamination, a conservative number of equipment blanks should be collected to confirm that materials in the sample equipment do not cause false positives by introducing PFASs. Other quality assurance methods may be implemented to avoid materials that could result in potential losses associated with PFASs adhering to surfaces. For example, collecting soil samples for laboratory analysis from an “undisturbed” portion of a large diameter soil core is a good practice.

The following additional notes are provided regarding soil sampling materials:

- Where drilling or decontamination water is needed, a sample of the source water must be collected and analyzed for PFAS before drilling begins to ensure that background PFASs will not be introduced. Some water systems may be constructed with PFAS-containing thread and gasket sealants; therefore, an inspection of the source water distribution system may provide an additional level of assurance for identifying a source of PFAS-free water for site inspections.
- It is often standard practice to cover the ends of sample sleeves and protect the sample from potential cross-contamination from the plastic end caps with Teflon™ or other PTFE tape (Geotechnical Services, Inc. 2018); this practice is prohibited for PFAS sample collection (DER 2016).
- Lexan™ liner sleeves are made of polycarbonate and they are not expected to contain PFASs based on review of the Safety Data Sheet (Sabic 2016).

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

- Acetate (i.e., cellulose acetate butyrate) liners are commonly used as sleeves and are not expected to contain PFASs.
- Studies evaluating the use of stainless steel indicate that PFASs do not strongly sorb to stainless-steel (Obal et al. 2012). Therefore, stainless-steel sleeves and equipment should be acceptable for collection of soil samples for PFAS analysis.

6 HEALTH AND SAFETY CONSIDERATIONS

Field activities associated with drilling, soil sampling, and monitoring well installation will be performed in accordance with the SSHP, a copy of which will be present on site during such activities.

7 PROCEDURE

The procedures for drilling, soil sampling, and installing groundwater monitoring wells (if necessary), are presented below. All field sampling should be completed by a two-person team, with one collecting the samples, and the other handling documentation and providing support. This will help to limit the potential for accidental cross-contamination of the sample media.

7.1 Direct Push Technology (DPT) Method

Direct-push drilling may be used to complete soil borings and install monitoring wells. Examples of this technique include the Diedrich ESP vibratory probe system, GeoProbe®, or AMS Power Probe® dual-tube system. Environmental probe systems typically use a hydraulically operated percussion hammer. Depending on the equipment used, the hammer delivers 140- to 350-foot pounds of energy with each blow. The hammer provides the force needed to penetrate very stiff to medium dense soil formations. The hammer simultaneously advances an outer steel casing that contains a dual-tube liner for sampling soil. The outside diameter (OD) of the outer casing ranges from 1.75 to 2.4 inches and the OD of the inner sampling tube ranges from 1.1 to 1.8 inches. The outer casing isolates shallow layers and permits the unit to continue to probe at depth. The double-rod system provides a borehole that may be tremie-grouted from the bottom up. Alternatively, the inside diameter (ID) of the steel casing provides clearance for the installation of small-diameter (e.g., 0.75- to 1-inch ID) micro-wells. The procedures for drilling, soil sampling, single-interval groundwater sampling, and installing monitoring wells in soil using the direct-push method are described below.

1. Place LDPE plastic sheeting over core/sampling processing area to create a clean working surface, if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity.
2. Clear the ground surface of brush, root mat, grass, leaves, or other debris prior to sampling.
3. Decontaminate all non-disposable sampling equipment and tooling that will or may to come into direct contact with soil prior to first use. Disposable sampling equipment must be kept in sealed PFAS-free packaging until it is used.
4. Use stainless-steel hand auger to collect samples from 0 - 5 ft bgs surface interval, if applicable. All hand auguring to collect soil samples will be completed by Arcadis personnel, not the drilling

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

subcontractor. These samples can be collected either during other Utility Clearance activities (e.g., third party clearance) or immediately prior to drilling.

   a. The sample should be collected manually directly from the hand auger bucket (using stainless steel scoop, spatula, or trowel as necessary) and placed directly into the sample jar, following Steps 7 – 15 below. The sample should not contact the ground or LDPE sheeting.
   b. If collecting multiple samples from the same boring, after collecting sample from the surface or shallowest depth interval examine the stability of the soil in the boring sidewalls. If sidewalls appear to be at risk of collapsing into the borehole insert a length of PVC pipe into the boring to maintain the opening and prevent collapse prior to augering to the next deeper sampling interval.

5. Use dual tube rod system and collect soil cores in acetate or Lexan ™ liners. The cutting shoe and core extractor must be stainless steel with no PFAS-containing materials present (e.g., gaskets, coatings).
6. After each drilling run, drillers extract and cut open liners and provide to Arcadis personnel for characterization and sampling. Drillers must not touch soil inside of liners during this process. Arcadis personnel decontaminate cutter between uses (see below).
7. Don a new set of nitrile gloves prior to handling sample core, then characterize soils in accordance with P-04 TGI - Soil Description (Arcadis 2018b). Record descriptions in the field notes, boring logs, and/or tablet/cell phone via Arcadis Fulcrum application. It is also beneficial to photo document the samples. It should be noted that logs collected via tablet or cell phone must be electronically backed up and transferred to a location accessible to other project team members as soon as feasible to retain and protect the field data.
8. Don a new set of nitrile gloves prior collecting soil samples for analysis. Do not use gloved hands to handle items (e.g., papers, pens, clothes) before collecting samples. Do not touch outside of sample liner with gloved hands.
9. Collect field samples and any required QC samples from recovered soil cores using a clean stainless-steel trowel and place in clean, labeled bottles supplied by the laboratory for the required analyses. If collecting samples for multiple analyses, collect PFAS samples first. Make sure caps remain on PFAS sample bottles until immediately prior to filling. Caps must remain in the hand of the sampler until replacing on the bottle.
10. Once the sample has been placed in the bottle, and the bottle cap has been completely tightened, label the sample with sample identification number, date, and time of collection. Labels must be completed only after the caps have been placed back on each bottle. (See P-01 QP#3.06 Field Activities documentation for sample label information).
11. Place soil sample bottles in a sealed Ziploc© bag, and then into sample coolers. Store PFAS samples in separate cooler from other samples.
12. Record the label information and time of sampling in the field notes and sampling forms.
13. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
14. Decontaminate all reusable sampling equipment between sample intervals and borings as described in Section 10.
15. Repeat Steps 7 – 14 until all samples have been collected from the boring location.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

16. Abandon soil boring to grade in accordance with the site-specific work plan upon completion and before moving to the next boring location. **If single-interval groundwater sample is required, see Section 7.1.1 for procedure. If well is to be installed, see Section 7.1.2 for well construction procedure**.
17. Mark boring location with wooden stake that identifies boring ID for subsequent surveying, as necessary.
18. Manage investigation-derived-waste (IDW) as specified in Section 8 and in accordance with the site-specific work plan.
19. If samples are not shipped the same day as collected, add fresh ice to sample coolers at the end of the day to maintain the temperature between 0 and 6°C. Place ice in sealed Ziplock® bags. Do not use blue ice. Sample coolers must remain in the possession of the sampling team at all times or secured under lock and key until shipment to the laboratory.

7.1.1 DPT Single-Interval Groundwater Sampling

The steps below describe the procedure for collecting a single-interval groundwater sample at a desired sample interval, commonly from the first encountered shallow groundwater. It should be verified that samples are taken below the water table (i.e., not perched water in the vadose zone). Single-interval sampling should be performed with a Geoprobe® SP-22 sampling device or similar (e.g., HydroPunch ™). A primary difference with single-interval methods relative to multi-interval vertical aquifer profiling (VAP) sampling is that the sampling screen is driven to the appropriate depth by the drill rig instead of lowering the sampling screen through the drill tools after reaching the appropriate depth. If multi-interval VAP sampling is required, refer to Arcadis TGI for Vertical Aquifer Profiling for PFAS Analysis (Arcadis 2019).

If using a Geoprobe® SP-22 sampling device, the following steps will be followed:

1. Ensure 4-gas meter, YSI 6-Series multi-parameter water quality probe, and turbidity meter are calibrated each morning (see QAPP worksheet #22 and P-09 Calibration and Control of Measuring and Test Equipment in PQAPP Appendix A). Document calibration results on equipment calibration log.
2. Advance Geoprobe® SP-22, equipped with stainless-steel screen, using standard Geoprobe® rods to the target depth interval in accordance with **Section 7.1**.
3. Retract the outer casing to expose the screen for the desired sample interval length, using extension rods to hold the screen in place. The Geoprobe® SP-22 sampling screen can be either 12” or 48”. Note: no soil cores will be retrieved using the Geoprobe® SP-22.
4. Go to Step 9.

If using a HydroPunch ™ sampling device, the following steps will be followed:

1. Ensure 4-gas meter, YSI 6-Series multi-parameter water quality probe, and turbidity meter are calibrated each morning (see QAPP worksheet #22 and P-09 Calibration and Control of Measuring and Test Equipment in PQAPP Appendix A). Document calibration results on equipment calibration log.
2. The drilling subcontractor will advance the borehole to approximately 2 feet above the depth from which a discrete water sample is to be obtained.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

3. The drilling subcontractor will disassemble the HydroPunch™ sampling device according to the manufacturer's instructions to allow the sampler to be decontaminated. The sampler should be completely disassembled, including O-rings and/or check valves.
4. Decontaminate the sampler per instructions in Section 10 as appropriate for the range of groundwater analytes to be sampled for, by washing with laboratory-grade detergent and potable water wash, followed by solvent rinse (if sampling for organics) and final rinse with deionized or distilled water. Check the condition of the O-rings during each cleaning and replace if necessary.
5. The drilling subcontractor will reassemble the decontaminated HydroPunch™ sampling device according to the manufacturer's instructions and lower the device to the bottom of the borehole.
6. The drilling subcontractor will push or drive the HydroPunch™ 5 feet below the bottom of the casing or augers, then retract the sampler 3 feet upward. Subsurface friction will retain the drive point in place, exposing the screen and allowing groundwater to enter the sampling tool.
7. Allow sufficient time to allow the sampler to fill with water. Typically, 30 minutes is sufficient, except in low permeability materials. If sufficient water has not accumulated in approximately 30 minutes, leave the temporary well casing and screen in the borehole to allow for overnight recovery of groundwater for follow-up sampling the next day.
8. Go to Step 9.

Complete the following steps for sample collection:

9. Place LDPE plastic sheeting adjacent to the sample port for use as a clean work area if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity. Do not allow vehicle exhaust to point towards the sample point.
10. Don a new set of nitrile gloves, connect tubing to sampling pump and flow-through cell, and slowly lower tubing and/or pump into well. If possible, use two field personnel to insert tubing/pump into well to avoid contact with surrounding ground surface or other materials that could cause cross-contamination. Insert tubing (peristaltic pump, if depth to water <25 ft bgs), or pump intake (small-diameter bladder pump, if depth to water >25 ft bgs) at the approximate mid-depth of the sampler screen interval.
    - Alternately, a Waterra-type inertial pump can be used to retrieve the water sample. If the formation has low-permeability and enough water is not anticipated in the tooling to allow purging of water, a stainless-steel bailer may be considered (after consulting with Arcadis RL).
11. Purge until water is visually clear of sediment, or for a maximum of 20 minutes before collecting GW samples.
    - Note: for low-permeability formations, collect a grab sample from the screen point sampling device and/or saturated soil sample from the soil core. Leave temporary well casing and screen in the borehole to allow for overnight recovery of groundwater for follow-up sampling the next day.
12. Don a new set of nitrile gloves prior to collecting groundwater sample and each QC sample. Do not use gloved hands to handle items (e.g., papers, pens, clothes, equipment) before collecting samples.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

13. Fill sample bottles using labeled HDPE bottles that are supplied by laboratory only. Ensure the cap remains on the bottle until immediately prior to sample collection and gets placed back on the bottle immediately after sample collection. Do not place the cap on any surface; keep in hand opposite of sample collection and do not touch the inside of the cap.
14. If high concentrations of PFASs related to Class B firefighting foams are expected in a groundwater sample (as specified in the QAPP Addendum), collect and shake a small portion of the sample (approximately 10-25 mL) on site. If foaming is observed, document the foaming on the sample log and on the COC to notify laboratory personnel. The “shaker test” vial can then be disposed of as specified in Section 8.
15. Collect QC samples at frequency specified in PQAPP Worksheet #20. QC sample locations to be selected based on consultation with Arcadis RL.
16. Place filled sample bottles in a sealed (Ziploc©) bag, record any label information that was not previously filled out (e.g., sample time). Record the label information and time of sampling in the field notes and sampling forms. Place samples into sample coolers. Store PFAS samples in separate cooler from any other types of samples.
17. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
18. Pull the Geoprobe® SP-22, HydroPunch™, or other sampling device back up and decontaminate per instructions in Section 10.

7.1.2 DPT Monitoring Well Construction

1. Upon advancing the borehole to the desired depth, install the well through the inner drill casing. The well will consist of 2-inch ID PVC or stainless-steel slotted screen and blank riser. Screen length and construction will be specified in the Work Plan or discussed with the Arcadis PM.

2. When the monitoring well assembly has been set in place, place a washed silica filter pack in the annular space from the bottom of the boring to a height of 1 to 2 feet above the top of the well screen (following specifications in the Work Plan) using a tremie pipe. The filter pack is placed, and drilling equipment (i.e., rods) extracted in increments until the top of the sand pack is at the appropriate depth. Verify that the expected volume of filter pack matches with the actual amount installed. There can be differences due to irregularities in the borehole. Washout of the borehole will result in the need for greater than calculated well materials. If a difference of more than 10% is noted, consult with the project technical team. The filter pack will be consistent with the screen slot size and the soil particle size in the screened interval, as specified in the Work Plan. The well should be gently surged to prevent filter pack material bridging and to settle the filter pack prior to well seal installation.

    a. Alternately, a monitoring well assembly with a pre-packed screen can be installed. The monitoring well assembly (i.e., regular PVC or pre-packed) should be discussed and decided prior to beginning field work and specified in the QAPP addendum. Pre-packed filters should be verified as PFAS-free prior to use.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

3. A hydrated bentonite seal (a minimum of 2 feet thick) will then be placed in the annular space above the sand pack (alternatively, in some cases a fine sand seal may be installed instead of bentonite—follow the specifications in the Work Plan). Use of a tremie pipe is not required for placement of the bentonite seal (though may be required if a well is very deep and borehole bridging is reasonably anticipated). However, bentonite should be poured into the annular space slowly enough to ensure borehole bridging does not occur. If non-hydrated bentonite is used, the bentonite should be permitted to hydrate in place for a minimum of 30 minutes before proceeding. *No coated bentonite pellets will be used in monitoring well drilling or construction*. PFAS-free water (verified by laboratory analysis of source water) should be added to hydrate the bentonite if the seal is above the water table. Continuously monitor the placement of the sand pack and bentonite with a weighted tape measure.

4. During the extraction of the augers or casing, a cement/bentonite or neat cement grout will be placed in the annular space from the bentonite seal to a depth approximately 2 ft bgs or as specified in the Work Plan. As with the filter pack, it is recommended that seal material be placed with a tremie pipe. Ensure that seal materials are mixed at the proper ratios with PFAS-free water (verified by laboratory analysis of source water) following manufacturer's recommendations.

5. Install the monitoring well completion as specified in the Work Plan. Typical completions are a locking, steel protective casing (extended at least 1.5 feet below grade and 2 feet above grade) over the riser casing set within a neat cement pad at grade. Alternatively, for flush-mount completions, place a steel curb box with a bolt-down lid over the riser casing set within a neat cement pad. In either case, the cement pad will extend approximately 1.5 to 2.0 feet below grade and laterally at least 1 foot in all directions from the protective casing and should slope gently away to promote drainage away from the well.

6. During well installation, record construction details and tabulate materials used in field notebook as well as appropriate field forms.

7. After completing the well installation, lock the well, clean the area, and dispose of materials in accordance with the procedures outlined in Section 8 below.

7.2 Rotosonic Drilling Methods

For sites with deep unconsolidated aquifers or challenging drilling conditions (e.g., presence of dense tills, caliche, cobbles), DPT drilling may not be feasible or cost effective due to limited production rates. In these cases, alternate drilling methods (e.g., rotosonic) are required. Rotosonic drilling produces soil cores that, for the most part, are relatively undisturbed, but note that when drilling in consolidated or finer-grained sediment the vibratory action during core barrel advancement may create secondary fractures or breaks.

1. Place LDPE plastic sheeting over core/sampling processing area to create a clean working surface, if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

2. Clear the ground surface of brush, root mat, grass, leaves, or other debris prior to sampling.
3. Decontaminate all non-disposable sampling equipment/tooling that will or may to come into direct contact with soil prior to first use. Disposable sampling equipment must be kept in sealed PFAS-free packaging until it is used.
4. Use stainless-steel hand auger to collect samples from 0 - 5 ft bgs surface interval, if applicable. All hand augering to collect soil samples will be completed by Arcadis personnel, not the drilling subcontractor. These samples can be collected either during other Utility Clearance activities (e.g., third party clearance) or immediately prior to drilling.
    a. Hand auger soil sample should be collected manually from the hand auger bucket (using stainless steel scoop, spatula, or trowel as necessary) and placed directly into the sample jar. The sample should not contact the ground or LDPE sheeting.
    b. If sampling by hand auger, after collecting sample from the surface or shallowest depth interval examine the stability of the soil in the boring sidewalls. If sidewalls appear to be at risk of collapsing into the borehole insert a length of polyvinyl chloride (PVC) pipe into the boring to maintain the opening and prevent collapse prior to augering to the next deeper sampling interval.
5. During rotosonic drilling, drillers extract soil core bags after each drilling run, place the core bag onto LDPE sheeting, and cut open bags so Arcadis personnel can perform characterization and sampling. Arcadis personnel should confirm with drilling subcontractor that core bags are constructed of PFAS-free material. Drillers must not touch soil inside of bags during this process. Arcadis personnel decontaminate cutter between uses (see below).
6. Don a new set of nitrile gloves prior to collecting each sample. Do not use gloved hands to handle papers, pens, clothes, etc., before collecting samples. Do not touch outside of sample bag with gloved hands.
7. During sampling, characterize soils in accordance with P-04 TGI - Soil Description (Arcadis 2018b). Record descriptions in the field notes, boring logs, and/or personal digital assistant (PDA). It is also beneficial to photo document the samples. It should be noted that PDA logs must be electronically backed up and transferred to a location accessible to other project team members as soon as feasible to retain and protect the field data.
8. Collect sample volumes from recovered soil cores using a clean stainless-steel trowel and place in clean, labeled bottles supplied by the laboratory for the required analyses (see sample container list in PQAPP Worksheets #19&30). Make sure caps remain on PFAS sample bottles until immediately prior to filling. Caps must remain in the hand of the sampler until replacing on the bottle.
9. Once the sample has been placed in the bottle, and the bottle cap has been completely tightened, label the sample with sample identification number, date, and time of collection. Labels must be completed only after the caps have been placed back on each bottle. (See P-01 QP#3.06 Field Activities documentation for sample label information).
10. Collect QC samples at frequency specified in PQAPP Worksheet #20. QC sample locations to be selected based on consultation with Arcadis RL.
11. Place soil sample bottles in a sealed Ziploc© bag, and then into sample coolers. Store PFAS samples in separate cooler from other samples.
12. Record the label information and time of sampling in the field notes and sampling forms.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

13. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
14. Abandon all soil borings to grade as specified in the QAPP Addendum upon completion and before moving to the next boring location. **If single-interval groundwater sample is required, see Section 7.2.1 for procedure. If well is to be installed, see Section 7.2.2 for well construction procedure**.
15. Mark boring location with wooden stake that identifies boring ID for subsequent surveying, as necessary.
16. Manage investigation-derived-waste (IDW) as specified in site-specific work plan.
17. If samples are not shipped the same day as collected, add fresh ice to sample coolers at the end of the day to maintain the temperature between 0 and 6°C. Place ice in sealed polyethylene bags (Ziplock). Do not use blue ice. See QAPP worksheet #19 and 30 for sample containers, preservation and hold times. Sample coolers must remain in the possession of the sampling team at all times or secured under lock and key until shipment to the laboratory.

7.2.1 Rotosonic Single-Interval Groundwater Sampling

Groundwater profilers can be used to collect single-interval groundwater samples at a desired sample interval, commonly biased towards transport zones determined from soil lithological core, or from the first encountered groundwater. If multi-interval VAP sampling is required, refer to Arcadis TGI for Vertical Aquifer Profiling for PFAS Analysis (Arcadis 2019).

The configuration of individual samplers varies based on their manufacturer and drilling contractor (e.g., Cascade Packer Isolation Groundwater Profiler, Geoprobe® SP-60 Packer Sampler). The overall strategy of rotosonic drilling sampling is consistent with DPT sampling; however, drilling with sonic or some rotary methods requires the introduction of drilling water that can potentially affect the integrity of the groundwater sample. If drilling water is used, a source blank sample will be collected prior to the start of work. If state or local regulations allow, source water can be spiked with non-toxic fluorescent dyes per Arcadis SOP for use of visible tracer in drilling fluid to obtain representative groundwater samples during drilling (Arcadis 2010).

Rotosonic single-interval groundwater sampling will be performed using dual-tube casing. Packer Isolation Groundwater Profilers will be used to conduct groundwater sampling. The biggest advantage of this device is that the groundwater sampling depth interval can be determined based on lithological logs obtained from the same borehole since hydraulic profiling tool is not deployable via rotosonic drilling methods.

The following steps will be followed:

1. Ensure 4-gas meter, YSI 6-Series multi-parameter water quality probe, and turbidity meter are calibrated each morning (see QAPP worksheet #22 and P-09 Calibration and Control of Measuring and Test Equipment in PQAPP Appendix A). Document calibration results on equipment calibration log.
2. Advance dual-tube sonic tooling casing to target depth interval in accordance with **Section 7.2**.
3. Retrieve the soil core and the inner sonic core barrel. Characterize soils in accordance with Arcadis TGI for Soil Descriptions (Arcadis 2018b).

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

4. Insert the stainless-steel screen and packer assembly (e.g., Cascade Packer Isolation Groundwater Profiler, Geoprobe® SP60 Packer Sampler) to the base of the sonic casing.
5. Extract the outer sonic casing to expose the screen to the formation.
6. Inflate the packer to isolate the screened interval from any water that might be above the packer in the sonic casing.
7. Place LDPE plastic sheeting adjacent to the sample port for use as a clean work area, if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity. Do not allow vehicle exhaust to point towards the sample point.
8. Don a new set of nitrile gloves, connect tubing to sampling pump and flow-through cell, and slowly lower tubing and/or pump into well. If possible, use two field personnel to insert tubing/pump into well to avoid contact with surrounding ground surface or other materials that could cause cross-contamination. Insert tubing (peristaltic pump, if depth to water <25 ft bgs), or pump intake (bladder pump, if depth to water >25 ft bgs) at the approximate mid-depth of the sampler screen interval.
9. Purge well until water is visually clear of sediment, or for a maximum of 20 minutes before collecting GW samples.
    - Note: for low-permeability formations, collect a grab sample from the screen point sampling device and/or saturated soil sample from the soil core. Leave temporary well casing and screen in the borehole to allow for overnight recovery of groundwater for follow-up sampling the next day.
10. Don a new set of nitrile gloves prior to collecting the groundwater sample and each QC sample. Do not use gloved hands to handle items (e.g., papers, pens, clothes, equipment) before collecting samples.
11. Fill sample bottles using labeled HDPE bottles that are supplied by laboratory only. Make sure that the cap remains on the bottle until immediately prior to sample collection and gets placed back on the bottle immediately after sample collection. Do not place the cap on any surface; keep in hand opposite of sample collection and do not touch the inside of the cap.
12. If high concentrations of PFASs related to Class B Firefighting foams are expected in a groundwater sample (as specified in the QAPP Addendum), collect and shake a small portion of the sample (approximately 10-25 mL) on site. If foaming is observed, document the foaming on the sample log and on the COC to notify laboratory personnel. The “shaker test” vial can then be disposed of as IDW as specified in Section 8.
13. Collect QC samples at frequency specified in PQAPP Worksheet #20. QC sample locations to be selected based on consultation with Arcadis RL;
14. Place filled sample bottles in a sealed (Ziploc©) bag, record any label information that was not pre-filled out (e.g., sample time). Record the label information and time of sampling in the field notes and sampling forms. Place samples into sample coolers. Store PFAS samples in separate cooler from any other types of samples.
15. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
16. Deflate the packer.
17. Pull the Packer Isolation Groundwater Profiler back up and decontaminate per instructions in Section 10.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

7.2.2 Rotosonic Monitoring Well Construction

1. If it is necessary to install a monitor well into a permeable zone below a confining layer, particularly if the deeper zone is believed to have water quality that differs significantly from the zone above the confining layer, then a telescopic well construction will be considered. In this case, the borehole is advanced approximately 3 to 5 feet into the top of the confining layer, and a permanent casing (typically PVC, black steel or stainless steel) is installed into the socket drilled into the top of the confining layer. The casing is then grouted in place. Grout should be mixed with PFAS-free water (verified by laboratory analysis of source water). The preferred methods of grouting telescoping casings include: pressure-injection grouting using an inflatable packer installed temporarily into the base of the casing, such that grout is injected out the bottom of the casing until it is observed at ground surface outside the casing; displacement-method grouting (also known as the Halliburton method), which entails filling the casing with grout and displacing the grout out the bottom of the casing by pushing a drillable plug, typically made of wood to the bottom of the casing, following by tremie grouting the remainder of the annulus outside the casing; or tremie grouting the annulus surrounding the casing using a tremie pipe installed to the base of the borehole. In all three cases, the casing is grouted to the ground surface, and the grout is allowed to set prior to drilling deeper through the casing. Site-specific criteria and work plans should be created for the completion of non-standard monitoring wells, including telescopic wells.

2. Before installing a screened well, it is important to confirm that the borehole has been advanced into the targeted saturated zone. This is particularly important for wells installed to monitor the water table and/or the shallow saturated zone, as the capillary fringe may cause soils above the water table to appear saturated. If one or more previously installed monitoring wells exist nearby, use the depth to water at such well(s) to estimate the water-table depth at the new borehole location.

   To verify that the borehole has been advanced into the saturated zone, it is necessary to measure the water level in the borehole. For boreholes drilled using water (e.g., Rotosonic), monitor the water level in the borehole as it re-equilibrates to the static level. In low-permeability units like clay, fine-grained glacial tills, shale and other bedrock formations, it may be necessary to wait overnight to allow the water level to equilibrate. Document depth to water in the borehole on the appropriate field forms and field notebook. If there are questions concerning the depth of the well/screen interval, consult with the project technical lead or PM prior to finalizing well depth/screen interval. To the extent practicable, ensure that the depth of the well below the apparent water table is deep enough so that the installed well can monitor groundwater year-round, accounting for seasonal water-table fluctuations. When in doubt, err on the side of slightly deeper well installation.

3. Upon completing the borehole to the desired depth, if a screened well construction is desired, install the monitoring well by lowering the screen and solid PVC risers through the augers or casing. Monitoring wells typically will be constructed of 2-inch-diameter (although sometimes 4-inch), flush-threaded PVC or stainless steel slotted or wire wrapped well screen and blank riser

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

casing. Smaller diameters may be used if multiple wells are to be installed in a single borehole. The screen length will be specified in the Work Plan (or equivalent) based on regulatory requirements and specific monitoring objectives. Monitoring well screens should be limited to 5 to 10 feet long. The screen length will depend on the purpose for the well and the objectives of the groundwater investigation and will (in most cases) be determined prior to the field mobilization.

The slot size and filter pack gradation should be predetermined in the Work Plan (or equivalent) based on site-specific grain-size analysis (sieve analysis) or other geologic considerations or monitoring objectives. Typically, slot sizes for monitoring wells will range from 0.010 inches to 0.020 inches while the filter pack will be 20-40, Morie No. 0, or equivalent. In very fine-grained formations where sample turbidity needs to be minimized, it may be preferred to use a 0.006-inch slot size and 30-65, Morie No. 00, or equivalent filter pack. Alternatively, where monitoring wells are installed in coarse-grained deposits and higher well yield is required, a 0.020-inch slot size and 10-20, Morie No. 1, or equivalent filter pack may be preferred. If the screen slot size and filter pack have not been based on site-specific grain-size analysis, consider collecting soil samples during well installation so future wells can be properly designed.

Alternately, a monitoring well assembly with a pre-packed screen can be installed. The monitoring well assembly (i.e., regular PVC or pre-packed) should be discussed and decided prior to beginning field work and specified in the QAPP addendum. Pre-packed filters should be verified as PFAS-free prior to use.

A blank riser will extend from the top of the screen to approximately 2.5 feet above grade or, if necessary, just below grade where conditions warrant a flush-mounted monitoring well. For wells greater than 50 feet deep, centralizers may be desired to assist in centering the monitoring well in the borehole during construction.

4. When the monitoring well assembly has been set in place, place a washed silica filter pack in the annular space from the bottom of the boring to a height of 1 to 2 feet above the top of the well screen (following specifications in the Work Plan) using a tremie. The filter pack is placed, and drilling equipment extracted in increments until the top of the sand pack is at the appropriate depth. Verify that the expected volume of filter pack matches with the actual amount installed. There can be differences due to irregularities in the borehole. Washout of the borehole will result in the need for greater than calculated well materials. If a difference of more than 10% is noted, consult with the project technical team. The filter pack will be consistent with the screen slot size and the soil particle size in the screened interval, as specified in the Work Plan (or equivalent). The well should be gently surged to prevent filter pack material bridging and to settle the filter pack prior to well seal installation.

5. A hydrated bentonite seal (a minimum of 2 feet thick) will then be placed in the annular space above the sand pack (alternatively, in some cases a fine sand seal may be installed instead of bentonite—follow the specifications in the Work Plan). Use of a tremie pipe is not required for placement of the bentonite seal (though may be required if a well is very deep and borehole

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

bridging is reasonably anticipated). However, bentonite should be poured into the annular space slowly enough to ensure borehole bridging does not occur. If non-hydrated bentonite is used, the bentonite should be permitted to hydrate in place for a minimum of 30 minutes before proceeding. *No coated bentonite pellets will be used in monitoring well drilling or construction*. PFAS-free water (verified by laboratory analysis of source water) should be added to hydrate the bentonite if the seal is above the water table. Continuously monitor the placement of the sand pack and bentonite with a weighted tape measure.

6. During the extraction of the augers or casing, a cement/bentonite or neat cement grout will be placed in the annular space from the bentonite seal to a depth approximately 2 ft bgs or as specified in the Work Plan (or equivalent). As with the filter pack, it is recommended that seal material be placed with a tremie pipe. Ensure that seal materials are mixed at the proper ratios with PFAS-free water (verified by laboratory analysis of source water) following manufacturer's recommendations.

7. Install the monitoring well completion as specified Work Plan (or equivalent). Typical completions are a locking, steel protective casing (extended at least 1.5 feet below grade and 2 feet above grade) over the riser casing and secure with a neat cement seal. Alternatively, for flush-mount completions, place a steel curb box with a bolt-down lid over the riser casing and secure with a neat cement seal. In either case, the cement seal will extend approximately 1.5 to 2.0 feet below grade and laterally at least 1 foot in all directions from the protective casing and should slope gently away to promote drainage away from the well.

8. Monitoring wells should be labeled using indelible ink or paint with the appropriate designation on both the inner and outer well casings or inside of the curb box lid. Use caution when labeling the well as paint or indelible ink could potentially contain PFAS materials.

9. When an above-grade completion is used, the riser will be sealed using an expandable locking plug and the top of the well will be vented by drilling a small-diameter (1/8 inch) hole near the top of the well casing or through the locking plug, or by cutting a vertical slot in the top of the well casing. When a flush-mount installation is used, the riser will be sealed using an unvented, expandable locking plug.

10. During well installation, record construction details and actual measurements relayed by the drilling contractor and tabulate materials used (e.g., screen and riser footages; bags of bentonite, cement, and sand) in the field notebook as well as appropriate field forms.

11. After completing the well installation, lock the well, clean the area, and dispose of materials in accordance with the procedures outlined in Section 8 below.

7.3 Hollow Stem Auger Drilling Methods

For some sites, direct push drilling may not be feasible and rotosonic drilling may not be cost effective. In these cases, hollow stem auger (HSA) drilling may be required. HSA drilling procedures are similar to

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

rotosonic drilling, but HSA is not well suited to very coarse materials (e.g. cobbles and boulder) and it produces disturbed soil samples.

1. Place LDPE plastic sheeting over core/sampling processing area to create a clean working surface, if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity.
2. Clear the ground surface of brush, root mat, grass, leaves, or other debris prior to sampling.
3. Decontaminate all non-disposable sampling equipment/tooling that will or may to come into direct contact with soil prior to first use. Disposable sampling equipment must be kept in sealed PFAS-free packaging until it is used.
4. Use stainless-steel hand auger to collect samples from 0 - 5 ft bgs surface interval, if applicable. All hand augering to collect soil samples will be completed by Arcadis personnel, not the drilling subcontractor. These samples can be collected either during other Utility Clearance activities (e.g., third party clearance) or immediately prior to drilling.
    a. Hand auger soil sample should be collected manually from the hand auger bucket (using stainless steel scoop, spatula, or trowel as necessary) and placed directly into the sample jar. The sample should not contact the ground or LDPE sheeting.
    b. If sampling by hand auger, after collecting sample from the surface or shallowest depth interval examine the stability of the soil in the boring sidewalls. If sidewalls appear to be at risk of collapsing into the borehole insert a length of polyvinyl chloride (PVC) pipe into the boring to maintain the opening and prevent collapse prior to augering to the next deeper sampling interval.
5. During HSA drilling, soil cuttings will accumulate around the outside of the borehole. Periodically the drillers will shovel cuttings into containers for disposal. Arcadis personnel can also perform characterization and sampling directly from these cuttings.
6. Drillers must not touch soil that will be collected for sampling. Arcadis personnel will use a stainless-steel spatula, spoon, or trowel to collect soil direct from the cuttings pile at the desired sample depth. Arcadis personnel decontaminate spatula, spoon, or trowel between uses in accordance with Section 10.
7. Don a new set of nitrile gloves prior to collecting each sample. Do not use gloved hands to handle papers, pens, clothes, etc., before collecting samples. Do not touch outside of sample bag with gloved hands.
8. During sampling, characterize soils in accordance with P-04 TGI - Soil Description (Arcadis 2018b). Record descriptions in the field notes, boring logs, and/or personal digital assistant (PDA). It is also beneficial to photo document the samples. It should be noted that PDA logs must be electronically backed up and transferred to a location accessible to other project team members as soon as feasible to retain and protect the field data.
9. Collect sample volumes from cuttings pile using a clean stainless-steel trowel and place in clean, labeled bottles supplied by the laboratory for the required analyses (see sample container list in PQAPP Worksheets #19&30). Make sure caps remain on PFAS sample bottles until immediately prior to filling. Caps must remain in the hand of the sampler until replacing on the bottle.
10. Once the sample has been placed in the bottle, and the bottle cap has been completely tightened, label the sample with sample identification number, date, and time of collection. Labels must be completed only after the caps have been placed back on each bottle. (See P-01 QP#3.06 Field Activities documentation for sample label information).

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

11. Collect QC samples at frequency specified in PQAPP Worksheet #20. QC sample locations to be selected based on consultation with Arcadis RL.
12. Place soil sample bottles in a sealed Ziploc© bag, and then into sample coolers. Store PFAS samples in separate cooler from other samples.
13. Record the label information and time of sampling in the field notes and sampling forms.
14. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
15. Abandon all soil borings to grade as specified in the QAPP Addendum upon completion and before moving to the next boring location. **If single-interval groundwater sample is required, see Section 7.3.1 for procedure. If well is to be installed, see Section 7.3.2 for well construction procedure**.
16. Mark boring location with wooden stake that identifies boring ID for subsequent surveying, as necessary.
17. Manage investigation-derived-waste (IDW) as specified in site-specific work plan.
18. If samples are not shipped the same day as collected, add fresh ice to sample coolers at the end of the day to maintain the temperature between 0 and 6°C. Place ice in sealed polyethylene bags (Ziplock). Do not use blue ice. See QAPP worksheet #19 and 30 for sample containers, preservation and hold times. Sample coolers must remain in the possession of the sampling team at all times or secured under lock and key until shipment to the laboratory.

7.3.1 Hollow Stem Auger Single-Interval Groundwater Sampling

Unlike direct push and rotosonic methods, there are limited single-interval groundwater sampling devices for HSA drilling. Commonly, groundwater samples will be collected with pre-packed PFAS-free temporary PVC well screen and PVC riser. This method is most appropriate for sampling the first encountered groundwater. Because soil samples are disturbed, it is often not possible to target specific intervals based on transport properties.

The following steps will be followed to collect the groundwater sample:

1. Ensure 4-gas meter, YSI 6-Series multi-parameter water quality probe, and turbidity meter are calibrated each morning (see QAPP worksheet #22 and P-09 Calibration and Control of Measuring and Test Equipment in PQAPP Appendix A). Document calibration results on equipment calibration log.
2. Advance augers until groundwater is encountered.
3. Arcadis will continuously characterize soil and/or rock cuttings.
4. When groundwater is encountered, the water level in the borehole will be allowed to reach static condition. If a grab groundwater sample is required, a pre-packed PFAS-free temporary PVC well screen will be lowered to the desired sample depth. Then, the augers will be raised to above the temporary well screen to expose the screen.
5. Place LDPE plastic sheeting adjacent to the sample port for use as a clean work area, if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity. Do not allow vehicle exhaust to point towards the sample point.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

6. Don a new set of nitrile gloves, connect tubing to sampling pump and flow-through cell and slowly lower tubing and/or pump into well. If possible, use two field personnel to insert tubing/pump into well to avoid contact with surrounding ground surface or other materials that could cause cross-contamination. Insert tubing (peristaltic pump, if depth to water <25 ft bgs), or pump intake (small-diameter bladder pump, if depth to water >25 ft bgs) at the approximate mid-depth of the sampler screen interval.
    a. Alternately, a Waterra-type inertial pump can be used to retrieve the water sample. If the formation has low-permeability and enough water is not anticipated in the tooling to allow purging of water, a stainless-steel bailer may be considered (after consulting with Arcadis RL).
7. Purge until water is visually clear of sediment, or for a maximum of 20 minutes before collecting GW samples.
    a. Note: for low-permeability formations, collect a grab sample from the screen point sampling device and/or saturated soil sample from the soil core. Leave temporary well casing and screen in the borehole to allow for overnight recovery of groundwater for follow-up sampling the next day.
8. Don a new set of nitrile gloves prior to collecting the groundwater sample and each QC sample. Do not use gloved hands to handle items (e.g., papers, pens, clothes, equipment) before collecting samples.
9. Fill sample bottles using labelled HDPE bottles that are supplied by laboratory only. Make sure that the cap remains on the bottle until immediately prior to sample collection and gets placed back on the bottle immediately after sample collection. Do not place the cap on any surface; keep in hand opposite of sample collection and do not touch the inside of the cap.
10. If high concentrations of PFASs related to Class B Firefighting foams are expected in a groundwater sample (as specified in the QAPP Addendum), collect and shake a small portion of the sample (approximately 10-25 mL) on site. If foaming is observed, document the foaming on the sample log and on the COC to notify laboratory personnel. The “shaker test’ vial can then be disposed of as IDW as specified in Section 8.
11. Collect QC samples at frequency specified in PQAPP Worksheet #20. QC sample locations to be selected based on consultation with Arcadis RL.
12. Place filled sample bottles in a sealed (Ziploc©) bag, record any label information that was not pre-filled out (e.g., sample time). Record the label information and time of sampling in the field notes and sampling forms. Place samples into sample coolers. Store PFAS samples in separate cooler from any other types of samples.
13. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
14. Retrieve the temporary well screen dispose of as specified in Section 8.

7.3.2 Hollow Stem Auger Monitoring Well Construction

HAS well construction methods are the same as when using rotosonic drilling methods and are outlined below.

1. If it is necessary to install a monitor well into a permeable zone below a confining layer, particularly if the deeper zone is believed to have water quality that differs significantly from the

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

zone above the confining layer, then a telescopic well construction will be considered. In this case, the borehole is advanced approximately 3 to 5 feet into the top of the confining layer, and a permanent casing (typically PVC, black steel or stainless steel) is installed into the socket drilled into the top of the confining layer. The casing is then grouted in place. Grout should be mixed with PFAS-free water (verified by laboratory analysis of source water). The preferred methods of grouting telescoping casings include: pressure-injection grouting using an inflatable packer installed temporarily into the base of the casing, such that grout is injected out the bottom of the casing until it is observed at ground surface outside the casing; displacement-method grouting (also known as the Halliburton method), which entails filling the casing with grout and displacing the grout out the bottom of the casing by pushing a drillable plug, typically made of wood to the bottom of the casing, following by tremie grouting the remainder of the annulus outside the casing; or tremie grouting the annulus surrounding the casing using a tremie pipe installed to the base of the borehole. In all three cases, the casing is grouted to the ground surface, and the grout is allowed to set prior to drilling deeper through the casing. Site-specific criteria and work plans should be created for the completion of non-standard monitoring wells, including telescopic wells.

2. Before installing a screened well, it is important to confirm that the borehole has been advanced into the targeted saturated zone. This is particularly important for wells installed to monitor the water table and/or the shallow saturated zone, as the capillary fringe may cause soils above the water table to appear saturated. If one or more previously installed monitoring wells exist nearby, use the depth to water at such well(s) to estimate the water-table depth at the new borehole location.

   To verify that the borehole has been advanced into the saturated zone, it is necessary to measure the water level in the borehole. For boreholes drilled using water (e.g., Rotosonic), monitor the water level in the borehole as it re-equilibrates to the static level. In low-permeability units like clay, fine-grained glacial tills, shale and other bedrock formations, it may be necessary to wait overnight to allow the water level to equilibrate. Document depth to water in the borehole on the appropriate field forms and field notebook. If there are questions concerning the depth of the well/screen interval, consult with the project technical lead or PM prior to finalizing well depth/screen interval. To the extent practicable, ensure that the depth of the well below the apparent water table is deep enough so that the installed well can monitor groundwater year-round, accounting for seasonal water-table fluctuations. When in doubt, err on the side of slightly deeper well installation.

3. Upon completing the borehole to the desired depth, if a screened well construction is desired, install the monitoring well by lowering the screen and solid PVC risers through the augers or casing. Monitoring wells typically will be constructed of 2-inch-diameter (although sometimes 4-inch), flush-threaded PVC or stainless steel slotted or wire wrapped well screen and blank riser casing. Smaller diameters may be used if multiple wells are to be installed in a single borehole. The screen length will be specified in the Work Plan (or equivalent) based on regulatory requirements and specific monitoring objectives. Monitoring well screens should be limited to 5 to

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

10 feet long. The screen length will depend on the purpose for the well and the objectives of the groundwater investigation and will (in most cases) be determined prior to the field mobilization.

The slot size and filter pack gradation should be predetermined in the Work Plan (or equivalent) based on site-specific grain-size analysis (sieve analysis) or other geologic considerations or monitoring objectives. Typically, slot sizes for monitoring wells will range from 0.010 inches to 0.020 inches while the filter pack will be 20-40, Morie No. 0, or equivalent. In very fine-grained formations where sample turbidity needs to be minimized, it may be preferred to use a 0.006-inch slot size and 30-65, Morie No. 00, or equivalent filter pack. Alternatively, where monitoring wells are installed in coarse-grained deposits and higher well yield is required, a 0.020-inch slot size and 10-20, Morie No. 1, or equivalent filter pack may be preferred. If the screen slot size and filter pack have not been based on site-specific grain-size analysis, consider collecting soil samples during well installation so future wells can be properly designed.

Alternately, a monitoring well assembly with a pre-packed screen can be installed. The monitoring well assembly (i.e., regular PVC or pre-packed) should be discussed and decided prior to beginning field work and specified in the QAPP addendum. Pre-packed filters should be verified as PFAS-free prior to use.

A blank riser will extend from the top of the screen to approximately 2.5 feet above grade or, if necessary, just below grade where conditions warrant a flush-mounted monitoring well. For wells greater than 50 feet deep, centralizers may be desired to assist in centering the monitoring well in the borehole during construction.

4. When the monitoring well assembly has been set in place, place a washed silica filter pack in the annular space from the bottom of the boring to a height of 1 to 2 feet above the top of the well screen (following specifications in the Work Plan) using a tremie. The filter pack is placed, and drilling equipment extracted in increments until the top of the sand pack is at the appropriate depth. Verify that the expected volume of filter pack matches with the actual amount installed. There can be differences due to irregularities in the borehole. Washout of the borehole will result in the need for greater than calculated well materials. If a difference of more than 10% is noted, consult with the project technical team. The filter pack will be consistent with the screen slot size and the soil particle size in the screened interval, as specified in the Work Plan (or equivalent). The well should be gently surged to prevent filter pack material bridging and to settle the filter pack prior to well seal installation.

5. A hydrated bentonite seal (a minimum of 2 feet thick) will then be placed in the annular space above the sand pack (alternatively, in some cases a fine sand seal may be installed instead of bentonite—follow the specifications in the Work Plan). Use of a tremie pipe is not required for placement of the bentonite seal (though may be required if a well is very deep and borehole bridging is reasonably anticipated). However, bentonite should be poured into the annular space slowly enough to ensure borehole bridging does not occur. If non-hydrated bentonite is used, the bentonite should be permitted to hydrate in place for a minimum of 30 minutes before proceeding.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

No coated bentonite pellets will be used in monitoring well drilling or construction. PFAS-free water (verified by laboratory analysis of source water) should be added to hydrate the bentonite if the seal is above the water table. Continuously monitor the placement of the sand pack and bentonite with a weighted tape measure.

6. During the extraction of the augers or casing, a cement/bentonite or neat cement grout will be placed in the annular space from the bentonite seal to a depth approximately 2 ft bgs or as specified in the Work Plan (or equivalent). As with the filter pack, it is recommended that seal material be placed with a tremie pipe. Ensure that seal materials are mixed at the proper ratios with PFAS-free water (verified by laboratory analysis of source water) following manufacturer's recommendations.

7. Install the monitoring well completion as specified Work Plan (or equivalent). Typical completions are a locking, steel protective casing (extended at least 1.5 feet below grade and 2 feet above grade) over the riser casing and secure with a neat cement seal. Alternatively, for flush-mount completions, place a steel curb box with a bolt-down lid over the riser casing and secure with a neat cement seal. In either case, the cement seal will extend approximately 1.5 to 2.0 feet below grade and laterally at least 1 foot in all directions from the protective casing and should slope gently away to promote drainage away from the well.

8. Monitoring wells should be labeled using indelible ink or paint with the appropriate designation on both the inner and outer well casings or inside of the curb box lid. Use caution when labeling the well as paint or indelible ink could potentially contain PFAS materials.

9. When an above-grade completion is used, the riser will be sealed using an expandable locking plug and the top of the well will be vented by drilling a small-diameter (1/8 inch) hole near the top of the well casing or through the locking plug, or by cutting a vertical slot in the top of the well casing. When a flush-mount installation is used, the riser will be sealed using an unvented, expandable locking plug.

10. During well installation, record construction details and actual measurements relayed by the drilling contractor and tabulate materials used (e.g., screen and riser footages; bags of bentonite, cement, and sand) in the field notebook as well as appropriate field forms.

11. After completing the well installation, lock the well, clean the area, and dispose of materials in accordance with the procedures outlined in Section 8 below.

7.4 Air Rotary Drilling Methods

For sites that require bedrock investigations but no collection of undisturbed rock cores, air rotary drilling may be required. Air rotary drilling procedures are similar to HSA. It produces disturbed soil and rock samples that are lifted to the surface by blowing compressed air into the borehole. Air rotary drilling is not well suited for situations that require high-resolution bedrock logging, but can be an effective way to generally characterize bedrock lithology and sample bedrock groundwater.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

1. Place LDPE plastic sheeting over sampling processing area to create a clean working surface, if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity.
2. Clear the ground surface of brush, root mat, grass, leaves, or other debris prior to sampling.
3. Decontaminate all non-disposable sampling equipment/tooling that will or may to come into direct contact with soil prior to first use. Disposable sampling equipment must be kept in sealed PFAS-free packaging until it is used.
4. Use stainless-steel hand auger to collect samples from 0 - 5 ft bgs surface interval, if applicable. All hand augering to collect soil samples will be completed by Arcadis personnel, not the drilling subcontractor. These samples can be collected either during other Utility Clearance activities (e.g., third party clearance) or immediately prior to drilling.
    a. Hand auger soil sample should be collected manually from the hand auger bucket (using stainless steel scoop, spatula, or trowel as necessary) and placed directly into the sample jar. The sample should not contact the ground or LDPE sheeting.
    b. If sampling by hand auger, after collecting sample from the surface or shallowest depth interval examine the stability of the soil in the boring sidewalls. If sidewalls appear to be at risk of collapsing into the borehole insert a length of polyvinyl chloride (PVC) pipe into the boring to maintain the opening and prevent collapse prior to augering to the next deeper sampling interval.
5. During air rotary drilling, soil and rock cuttings will accumulate around the outside of the borehole. Periodically the drillers will shovel cuttings into containers for disposal. Arcadis personnel can also perform characterization and sampling directly from these cuttings.
6. Drillers must not touch soil that will be collected for sampling. Arcadis personnel will use a stainless-steel spatula, spoon, or trowel to collect soil direct from the cuttings pile at the desired sample depth. Arcadis personnel decontaminate spatula, spoon, or trowel between uses in accordance with Section 10.
7. Don a new set of nitrile gloves prior to collecting each sample. Do not use gloved hands to handle papers, pens, clothes, etc., before collecting samples. Do not touch outside of sample bag with gloved hands.
8. During sampling, characterize soils in accordance with P-04 TGI - Soil Description (Arcadis 2018b). Record descriptions in the field notes, boring logs, and/or personal digital assistant (PDA). It is also beneficial to photo document the samples. It should be noted that PDA logs must be electronically backed up and transferred to a location accessible to other project team members as soon as feasible to retain and protect the field data.
9. Collect sample volumes from cuttings pile using a clean stainless-steel trowel and place in clean, labeled bottles supplied by the laboratory for the required analyses (see sample container list in PQAPP Worksheets #19&30). Make sure caps remain on PFAS sample bottles until immediately prior to filling. Caps must remain in the hand of the sampler until replacing on the bottle.
10. Once the sample has been placed in the bottle, and the bottle cap has been completely tightened, label the sample with sample identification number, date, and time of collection. Labels must be completed only after the caps have been placed back on each bottle. (See P-01 QP#3.06 Field Activities documentation for sample label information).
11. Collect QC samples at frequency specified in PQAPP Worksheet #20. QC sample locations to be selected based on consultation with Arcadis RL.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

12. Place soil sample bottles in a sealed Ziploc© bag, and then into sample coolers. Store PFAS samples in separate cooler from other samples.
13. Record the label information and time of sampling in the field notes and sampling forms.
14. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
15. Abandon all soil borings to grade as specified in the QAPP Addendum upon completion and before moving to the next boring location. **If single-interval groundwater sample is required, see Section 7.4.1 for procedure. If well is to be installed, see Section 7.4.2 for well construction procedure**.
16. Mark boring location with wooden stake that identifies boring ID for subsequent surveying, as necessary.
17. Manage investigation-derived-waste (IDW) as specified in site-specific work plan.
18. If samples are not shipped the same day as collected, add fresh ice to sample coolers at the end of the day to maintain the temperature between 0 and 6°C. Place ice in sealed polyethylene bags (Ziplock). Do not use blue ice. See QAPP worksheet #19 and 30 for sample containers, preservation and hold times. Sample coolers must remain in the possession of the sampling team at all times or secured under lock and key until shipment to the laboratory.

7.4.1 Air Rotary Single-Interval Groundwater Sampling

Similar to HSA drilling methods, there are limited single-interval groundwater sampling devices for air rotary drilling. Commonly, groundwater samples will be collected with pre-packed PFAS-free temporary PVC well screen and PVC riser. This method is most appropriate for sampling the first encountered groundwater when it is expected to occur in bedrock. Because soil and rock samples are disturbed, it is often not possible to target specific intervals based on transport properties. Unlike single-interval groundwater sampling with DPT, rotosonic, and HSA boreholes, the central opening of the air rotary drill bit is too narrow to accommodate a pre-packed PFAS-free temporary PVC well screen. Therefore, complete removal of air rotary drill tooling is required to collect single-interval groundwater samples. After removal of drill tooling, groundwater samples will be collected by inserting the pre-packed PFAS-free temporary PVC well screen through the open borehole to the desired sample depth.. In some air rotary drilling scenarios, air rotary drill tooling is advanced through a temporary casing (e.g. larger-diameter augers) in order to prevent borehole collapse, typically in the overburden above bedrock. It is not necessary to remove the temporary casing to collect groundwater samples in those scenarios.

The following steps will be followed to collect the groundwater sample:

1. Ensure 4-gas meter, YSI 6-Series multi-parameter water quality probe, and turbidity meter are calibrated each morning (see QAPP worksheet #22 and P-09 Calibration and Control of Measuring and Test Equipment in PQAPP Appendix A). Document calibration results on equipment calibration log.
2. Advance rotary bit until groundwater is encountered.
3. Arcadis will continuously characterize soil and/or rock cuttings.
4. When groundwater is encountered, the water level in the borehole will be allowed to reach static condition. If a grab groundwater sample is required, remove all air rotary tooling from the

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

borehole and insert a pre-packed PFAS-free temporary PVC well screen to the desired sample depth.

5. Place LDPE plastic sheeting adjacent to the sample port for use as a clean work area, if conditions allow. Otherwise, prevent sampling equipment from contacting the ground or other surface that could compromise sample integrity. Do not allow vehicle exhaust to point towards the sample point.
6. Don a new set of nitrile gloves, connect tubing to sampling pump and flow-through cell and slowly lower tubing and/or pump into well. If possible, use two field personnel to insert tubing/pump into well to avoid contact with surrounding ground surface or other materials that could cause cross-contamination. Insert tubing (peristaltic pump, if depth to water <25 ft bgs), or pump intake (small-diameter bladder pump, if depth to water >25 ft bgs) at the approximate mid-depth of the sampler screen interval.
    a. Alternately, a Waterra-type inertial pump can be used to retrieve the water sample. If the formation has low-permeability and enough water is not anticipated in the tooling to allow purging of water, a stainless-steel bailer may be considered (after consulting with Arcadis RL).
7. Purge until water is visually clear of sediment, or for a maximum of 20 minutes before collecting GW samples.
    a. Note: for low-permeability formations, collect a grab sample from the screen point sampling device and/or saturated soil sample from the soil core. Leave temporary well casing and screen in the borehole to allow for overnight recovery of groundwater for follow-up sampling the next day.
8. Don a new set of nitrile gloves prior to collecting the groundwater sample and each QC sample. Do not use gloved hands to handle items (e.g., papers, pens, clothes, equipment) before collecting samples.
9. Fill sample bottles using labelled HDPE bottles that are supplied by laboratory only. Make sure that the cap remains on the bottle until immediately prior to sample collection and gets placed back on the bottle immediately after sample collection. Do not place the cap on any surface; keep in hand opposite of sample collection and do not touch the inside of the cap.
10. If high concentrations of PFASs related to Class B Firefighting foams are expected in a groundwater sample (as specified in the QAPP Addendum), collect and shake a small portion of the sample (approximately 10-25 mL) on site. If foaming is observed, document the foaming on the sample log and on the COC to notify laboratory personnel. The “shaker test’ vial can then be disposed of as IDW as specified in Section 8.
11. Collect QC samples at frequency specified in PQAPP Worksheet #20. QC sample locations to be selected based on consultation with Arcadis RL.
12. Place filled sample bottles in a sealed (Ziploc©) bag, record any label information that was not pre-filled out (e.g., sample time). Record the label information and time of sampling in the field notes and sampling forms. Place samples into sample coolers. Store PFAS samples in separate cooler from any other types of samples.
13. Fill out laboratory COC and check against the labels on the sample bottles progressively after each sample is collected.
14. Retrieve the temporary well screen dispose of as specified in Section 8.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

7.4.2 Air Rotary Monitoring Well Construction

Air rotary well construction methods are the same as when using HSA drilling methods and are outlined below.

1. If it is necessary to install a monitor well into a permeable zone below a confining layer, particularly if the deeper zone is believed to have water quality that differs significantly from the zone above the confining layer, then a telescopic well construction will be considered. In this case, the borehole is advanced approximately 3 to 5 feet into the top of the confining layer, and a permanent casing (typically PVC, black steel or stainless steel) is installed into the socket drilled into the top of the confining layer. The casing is then grouted in place. Grout should be mixed with PFAS-free water (verified by laboratory analysis of source water). The preferred methods of grouting telescoping casings include: pressure-injection grouting using an inflatable packer installed temporarily into the base of the casing, such that grout is injected out the bottom of the casing until it is observed at ground surface outside the casing; displacement-method grouting (also known as the Halliburton method), which entails filling the casing with grout and displacing the grout out the bottom of the casing by pushing a drillable plug, typically made of wood to the bottom of the casing, following by tremie grouting the remainder of the annulus outside the casing; or tremie grouting the annulus surrounding the casing using a tremie pipe installed to the base of the borehole. In all three cases, the casing is grouted to the ground surface, and the grout is allowed to set prior to drilling deeper through the casing. Site-specific criteria and work plans should be created for the completion of non-standard monitoring wells, including telescopic wells.

2. Before installing a screened well, it is important to confirm that the borehole has been advanced into the targeted saturated zone. This is particularly important for wells installed to monitor the water table and/or the shallow saturated zone, as the capillary fringe may cause soils above the water table to appear saturated. If one or more previously installed monitoring wells exist nearby, use the depth to water at such well(s) to estimate the water-table depth at the new borehole location.

   To verify that the borehole has been advanced into the saturated zone, it is necessary to measure the water level in the borehole. For boreholes drilled using water (e.g., Rotosonic), monitor the water level in the borehole as it re-equilibrates to the static level. In low-permeability units like clay, fine-grained glacial tills, shale and other bedrock formations, it may be necessary to wait overnight to allow the water level to equilibrate. Document depth to water in the borehole on the appropriate field forms and field notebook. If there are questions concerning the depth of the well/screen interval, consult with the project technical lead or PM prior to finalizing well depth/screen interval. To the extent practicable, ensure that the depth of the well below the apparent water table is deep enough so that the installed well can monitor groundwater year-round, accounting for seasonal water-table fluctuations. When in doubt, err on the side of slightly deeper well installation.

3. Upon completing the borehole to the desired depth, if a screened well construction is desired, install the monitoring well by lowering the screen and solid PVC risers through the augers or

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

casing. Monitoring wells typically will be constructed of 2-inch-diameter (although sometimes 4-inch), flush-threaded PVC or stainless steel slotted or wire wrapped well screen and blank riser casing. Smaller diameters may be used if multiple wells are to be installed in a single borehole. The screen length will be specified in the Work Plan (or equivalent) based on regulatory requirements and specific monitoring objectives. Monitoring well screens should be limited to 5 to 10 feet long. The screen length will depend on the purpose for the well and the objectives of the groundwater investigation and will (in most cases) be determined prior to the field mobilization.

The slot size and filter pack gradation should be predetermined in the Work Plan (or equivalent) based on site-specific grain-size analysis (sieve analysis) or other geologic considerations or monitoring objectives. Typically, slot sizes for monitoring wells will range from 0.010 inches to 0.020 inches while the filter pack will be 20-40, Morie No. 0, or equivalent. In very fine-grained formations where sample turbidity needs to be minimized, it may be preferred to use a 0.006-inch slot size and 30-65, Morie No. 00, or equivalent filter pack. Alternatively, where monitoring wells are installed in coarse-grained deposits and higher well yield is required, a 0.020-inch slot size and 10-20, Morie No. 1, or equivalent filter pack may be preferred. If the screen slot size and filter pack have not been based on site-specific grain-size analysis, consider collecting soil samples during well installation so future wells can be properly designed.

Alternately, a monitoring well assembly with a pre-packed screen can be installed. The monitoring well assembly (i.e., regular PVC or pre-packed) should be discussed and decided prior to beginning field work and specified in the QAPP addendum. Pre-packed filters should be verified as PFAS-free prior to use.

A blank riser will extend from the top of the screen to approximately 2.5 feet above grade or, if necessary, just below grade where conditions warrant a flush-mounted monitoring well. For wells greater than 50 feet deep, centralizers may be desired to assist in centering the monitoring well in the borehole during construction.

4. When the monitoring well assembly has been set in place, place a washed silica filter pack in the annular space from the bottom of the boring to a height of 1 to 2 feet above the top of the well screen (following specifications in the Work Plan) using a tremie. The filter pack is placed, and drilling equipment extracted in increments until the top of the sand pack is at the appropriate depth. Verify that the expected volume of filter pack matches with the actual amount installed. There can be differences due to irregularities in the borehole. Washout of the borehole will result in the need for greater than calculated well materials. If a difference of more than 10% is noted, consult with the project technical team. The filter pack will be consistent with the screen slot size and the soil particle size in the screened interval, as specified in the Work Plan (or equivalent). The well should be gently surged to prevent filter pack material bridging and to settle the filter pack prior to well seal installation.

5. A hydrated bentonite seal (a minimum of 2 feet thick) will then be placed in the annular space above the sand pack (alternatively, in some cases a fine sand seal may be installed instead of

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

bentonite—follow the specifications in the Work Plan). Use of a tremie pipe is not required for placement of the bentonite seal (though may be required if a well is very deep and borehole bridging is reasonably anticipated). However, bentonite should be poured into the annular space slowly enough to ensure borehole bridging does not occur. If non-hydrated bentonite is used, the bentonite should be permitted to hydrate in place for a minimum of 30 minutes before proceeding. *No coated bentonite pellets will be used in monitoring well drilling or construction*. PFAS-free water (verified by laboratory analysis of source water) should be added to hydrate the bentonite if the seal is above the water table. Continuously monitor the placement of the sand pack and bentonite with a weighted tape measure.

6. During the extraction of the augers or casing, a cement/bentonite or neat cement grout will be placed in the annular space from the bentonite seal to a depth approximately 2 ft bgs or as specified in the Work Plan (or equivalent). As with the filter pack, it is recommended that seal material be placed with a tremie pipe. Ensure that seal materials are mixed at the proper ratios with PFAS-free water (verified by laboratory analysis of source water) following manufacturer's recommendations.

7. Install the monitoring well completion as specified Work Plan (or equivalent). Typical completions are a locking, steel protective casing (extended at least 1.5 feet below grade and 2 feet above grade) over the riser casing and secure with a neat cement seal. Alternatively, for flush-mount completions, place a steel curb box with a bolt-down lid over the riser casing and secure with a neat cement seal. In either case, the cement seal will extend approximately 1.5 to 2.0 feet below grade and laterally at least 1 foot in all directions from the protective casing and should slope gently away to promote drainage away from the well.

8. Monitoring wells should be labeled using indelible ink or paint with the appropriate designation on both the inner and outer well casings or inside of the curb box lid. Use caution when labeling the well as paint or indelible ink could potentially contain PFAS materials.

9. When an above-grade completion is used, the riser will be sealed using an expandable locking plug and the top of the well will be vented by drilling a small-diameter (1/8 inch) hole near the top of the well casing or through the locking plug, or by cutting a vertical slot in the top of the well casing. When a flush-mount installation is used, the riser will be sealed using an unvented, expandable locking plug.

10. During well installation, record construction details and actual measurements relayed by the drilling contractor and tabulate materials used (e.g., screen and riser footages; bags of bentonite, cement, and sand) in the field notebook as well as appropriate field forms.

11. After completing the well installation, lock the well, clean the area, and dispose of materials in accordance with the procedures outlined in Section 8 below.

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

8 WASTE MANAGEMENT

Investigation-derived waste (IDW) including soil cuttings, purge water, and decontamination water generated during cleaning procedures will be collected and placed in Department of Transportation approved containers, segregated by waste streams: see the Investigation-Derived Waste Handling and Storage TGI for details (Arcadis 2017c). All containers will be labeled as non-hazardous unless otherwise instructed by the project manager. Containerized IDW will be stored on site until it is profiled and subsequently transported to an approved facility for disposal or recycling. Waste manifests for all IDW suspected to have come into contact with PFAS should clearly note the presence of PFAS. Additional IDW sampling and management details will be provided in the site-specific Work Plan (QAPP addendum) and will be consistent with applicable Army policies and Army post requirements. Personal protective equipment (e.g., gloves, disposable clothing, disposable equipment) resulting from personnel cleaning procedures and soil sampling activities will be placed in plastic bags. These bags will be transferred into appropriately labeled waste containers for appropriate disposal.

9 DATA RECORDING AND MANAGEMENT

The supervising field lead will be responsible for documenting drilling events to record all relevant information in a clear and concise format. The record of drilling events should include:

- Start and finish drilling dates;
- Project name and location;
- Project number, client, and site location;
- Boring number and depths;
- Soil descriptions;
- Depth to water;
- Well construction specifications, if applicable (screen and riser material and diameter, sump length, screen length and slot size, riser length, sand pack type);
- Quantities of materials used (e.g., bentonite, grout);
- Type of drilling tools used (e.g., rig type);
- Core barrel size;
- Names of contractor's drillers, inspectors, or other people onsite; and,
- Weather conditions.

Field staff should ensure COC Forms are properly completed, and verify which PFAS analytes (e.g., just PFOS and PFOA, some or all of the modified method 537 target analyte list) are required for analysis and note on the COC.

All documents (and photographs) should be scanned and electronically filed in the appropriate project directory for easy access. In addition, the locations of newly-installed wells will be documented

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

photographically or in a site sketch. If appropriate, a measuring wheel or engineer's tape will be used to determine approximate distances between important site features.

The well location, ground surface elevation, and inner and outer casing elevations will be surveyed using the method specified in the site Work Plan. Generally, a local baseline control will be set up. This local baseline control can then be tied into the appropriate vertical and horizontal datum, such as the National Geodetic Vertical Datum of 1929 or 1988 and the State Plane Coordinate System. At a minimum, the elevation of the top of the inner casing used for water-level measurements should be measured to the nearest 0.01 foot. Elevations will be established in relation to the National Geodetic Vertical Datum of 1929. A permanent mark will be placed on top of the inner casing to mark the point for water-level measurements.

10 DECONTAMINATION

To avoid cross-contamination during drilling and sampling, all reusable groundwater sampling equipment that has or is suspected to have come into contact with groundwater or soil will be decontaminated between each sample using the following steps. If Class B firefighting foam is a suspected PFAS source at any sampling location, then these steps should be performed twice.

- Don new pair of Nitrile gloves prior to decontamination
- Scrub using a plastic brush and a non-phosphate soap free of VOCs (e.g., Liquinox, Alconox) and plastic brush;
- Double-rinse in potable deionized or distilled water;
- Rinse once with methanol or isopropyl alcohol;
- Rinse once with laboratory-certified PFAS-free water;
- Collect all rinsate in a sealed pail for disposal
- Allow time for equipment to air dry prior to re-use.

While strongly recommended, the use of solvents may be excluded for project-specific H&S concerns. If solvents are prohibited after DQO development, then additional procedures should be evaluated by the project team. Contingencies could include the use of dedicated sampling equipment at each sampling location or amending laboratory procedures to mitigate the increased risk of cross-contamination.

Additionally, the following decontamination procedure could be utilized when organic solvent use is not possible.

- Don new pair of Nitrile gloves prior to decontamination
- Scrub using a plastic brush and a non-phosphate soap free of VOCs (e.g., Liquinox, Alconox) and plastic brush;
- Single-rinse in potable deionized or distilled water;
- Scrub using a plastic brush and a non-phosphate soap free of VOCs (e.g., Liquinox, Alconox) and plastic brush;

Downloaded and printed copies from the Approved Procedure Library are uncontrolled documents.

- Rinse twice with deionized water and once with PFAS-free water;
- Collect all rinsate in a sealed pail for disposal
- Allow time for equipment to air dry prior to re-use.

Drive casings and other drilling tooling will be steam cleaned or replaced with new equipment between boreholes. Steam cleaning will be performed by the drillers within a temporary decontamination or other containment area designated by the supervising engineer or geologist that is located outside of the work zone. All decontamination water will be collected and containerized for disposal.

See additional specifics in P-04, TGI - Groundwater and Soil Sampling Equipment Decontamination in PQAPP Appendix A.

11QUALITY ASSURANCE

In general, the following quality assurance and quality control (QA/QC) samples should be collected:

- Equipment blanks
- Field (i.e., reagent) blanks
- Field duplicates
- Matrix spike/matrix spike duplicate

Details on QC sampling requirements (e.g., frequency of collection, types of QA/QC samples) are provided in the PQAPP and will be outlined in various Site-specific sampling scopes of work in the QAPP Addendum. Additionally, detailed procedures related to equipment and field (i.e., reagent) blank sample collection are outlined in the Equipment and Reagent Blank Sample Collection TGI (Arcadis 2018c). In general, equipment blanks should be collected from every piece of downhole equipment that could come in contact with soil or groundwater during sample collection. This includes all downhole tooling (e.g., drill bits, drill rods).

Prior to initiating field activities, water sources to be used during drilling and well construction activities should be sampled to verify those sources are PFAS-free. While not part of the PQAPP, this is considered best practice and should be completed to the extent possible.

Refer to quality control requirements for the project to ensure that appropriate quality assurance and quality control (QA/QC) samples are collected. When collecting QA/QC samples, the same guidelines apply as when collecting regular samples – specifically that:

- Samples should be collected in laboratory-supplied HDPE bottles;
- Bottle caps must remain in the hand of the sampler until replaced on the bottle;
- Labels must be completed after the caps have been placed back on each bottle; and,
- Samples must be stored in appropriate transport containers (coolers) with ice (Ziploc®-type bags for use as ice containers) with appropriate labeling. **Do not use blue ice. Store PFAS samples in a separate cooler from other types of samples.**

EXECUTIVE SUMMARY

The United States Army Environmental Command (USAEC) is conducting a nationwide survey at select continental and outside continental United States Army Installation Management Command, Army Materiel Command, and United States Army Reserve Command Installations through a Preliminary Assessment process to determine where impacts from per- and polyfluoroalkyl substances (PFASs) may be present. Aqueous film forming foam (AFFF), a material known to historically contain high concentrations of long-chain PFASs, was used for fire training and emergency response at many installations and is thought to be the primary source of PFAS releases to environmental media. As emerging contaminants, there has been considerable evolution in both the sampling and analysis of PFASs in impacted environmental media over the past ten years. This white paper is intended to provide an overview of best sampling and analysis practices available for PFASs in environmental media and provide recommendations so that any eventual USAEC PFAS data collection efforts are conducted according to reliable, representative, and accurate procedures.

Soil and groundwater sampling techniques for PFAS sample collection will typically follow industry standards with special considerations related to the sampling materials and their compatibility with PFASs. The following material compatibility concerns should be closely followed:

- High density polyethylene (HDPE) and, to a lesser extent, polypropylene sampling materials and containers are recommended. The use of glass sampling containers is not recommended as PFASs adhere to the surface of glass.
- Teflon™ (or other polytetrafluoroethylene - PTFE) materials should be strictly avoided for PFAS sample collection.
- Samples should not be filtered in the field or in the laboratory, as most types of filters retain PFASs. Centrifugation, followed by combining a solvent rinse of the particulate-containing centrifuge tube with the sample, is recommended to remove particles in turbid aqueous samples at the laboratory.
- All disposable sampling materials should be treated as single use.
- Decontamination of reusable equipment should be conducted with PFAS-free water, Alconox®, Liquinox®, Citranox®, or a solvent such as methanol, isopropanol, or acetone, pending safety considerations at the site.
- To avoid cross-contamination of PFASs from common low-level sources, personal care products should only be used for medical or health and safety reasons and all food consumption should occur offsite, preferably with outer field gear removed prior to eating.

Field-collected quality control samples should include a conservative number of separate equipment blanks for all types of reusable equipment that has direct contact with samples, field reagent blanks, field duplicates, matrix spikes and matrix spike duplicates, particularly in the material cannot be verified to be PFAS-free. Multiple bottles of highly sensitive aqueous samples should be sent to the laboratory in the event that re-analysis is required, as most laboratories are required to analyze the entire sample bottle during the first analysis.

Laboratory analysis of PFASs in groundwater, surface water, soil, and sediment should follow the guidelines laid out in the Department of Defense Quality Systems Manual (QSM) 5.1 or later version of the QSM to which the laboratory is accredited. Any commercial laboratory used for these analyses must be accredited for QSM 5.1 or later. Currently, there is only one United States Environmental Protection Agency (USEPA) method, USEPA Method 537 Version 1.1, available for the analysis of PFASs and it pertains specifically to drinking water. The laboratory conducting PFAS analysis is required by QSM 5.1 and USEPA Method 537 to include a laboratory control sample and method blank per preparatory batch. Aqueous preparation methods for analysis of PFASs are relatively prescribed by QSM 5.1 and, even more so, by USEPA Method 537. Soil preparation methods are not well defined by these official documents. Serial basic methanolic extractions are used by most researchers and commercial laboratories for analysis of PFASs in soils and other environmental solids. These methods are acceptable for most PFASs of current interest to the DoD, including anionic compounds like perfluorooctanoic acid (PFOA), and perfluorooctanesulfonic acid (PFOS), and 6:2 fluorotelomer sulfonate. With appropriate precautions for sample equipment, materials, and laboratory methods and procedures, the existing state of science provides an adequate foundation for collecting data of sufficient quality to make determinations regarding PFAS levels of contamination in environmental media.

1 INTRODUCTION

The United States (U.S.) Army Environmental Command (USAEC) is conducting a nationwide survey at select continental and outside continental United States Army Installation Management Command, Army Materiel Command, and United States Army Reserve Command Installations through a Preliminary Assessment process to determine where impacts from per- and polyfluoroalkyl substances (PFASs) may be present. The primary sources of PFASs at these installations are expected to be releases from the emergency use, training, and accidental discharge of aqueous film forming foam (AFFF), a material known to contain high concentrations of PFASs. In anticipation of site investigation activities to quantify PFASs, USAEC commissioned this white paper to provide an overview of the state of science of sampling and analysis for PFASs in environmental media. The objectives of this white paper are to provide sampling and analysis recommendations in order to enhance assurance that PFAS data collection efforts are reliable, representative, and accurate.

PFASs are a class of several thousand individual compounds that each contain a fully fluorinated carbon group known as a perfluoroalkyl group. The perfluoroalkyl substances are primarily composed of perfluoroalkyl acids (PFAAs) that consist of a perfluoroalkyl group bound to either a sulfonic or carboxylic acid functional group. The PFAAs do not contain any carbon hydrogen bonds, are completely resistant to environmental degradation (Vecitis et al. 2009) and tend to range in chain length from four carbons (C4) to fourteen carbons (C14); the two most common PFAAs, both by manufacturing volumes and environmental occurrence, are perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS). The polyfluoroalkyl substances contain a range of additional structural features, in addition to the perfluoroalkyl group, and are susceptible to transformation. The polyfluoroalkyl substances are often referred to as PFAA precursors, as they form PFAAs as terminal transformation products in the environment. In AFFF formulations that were used at multiple Department of Defense (DoD) installations, both per- and polyfluoroalkyl compounds have been commonly identified (Place and Field 2012) and detected in soil and groundwater impacted by AFFF (Moody and Field 1999, Schultz et al. 2004, Backe et al. 2013, Houtz et al. 2013, McGuire et al. 2014). PFASs are routinely referred to by or in reference to their perfluoroalkyl chain length. Long chain perfluoroalkyl sulfonic acids contain at least six fluorinated carbons (perfluorohexanesulfonic acid [PFHxS] and longer) and long chain perfluoroalkyl carboxylic acids contain at least seven fluorinated carbons (PFOA and longer); PFASs with fewer fluorinated carbons are referred to as short chain PFASs. Both PFOS and PFOA are considered long chain PFASs as they contain eight and seven fluorinated carbons, respectively.

Environmental sampling and analysis for the measurement of PFASs began in the late 1990's, led by academic researchers (Moody and Field 1999, Giesy and Kannan 2001). While environmental samples for PFASs have been collected at DoD installations since that time (Moody and Field 1999, Schultz et al. 2004, Moody et al. 2003, McGuire et al. 2014), DoD branch level programmatic approaches to PFAS sampling and analysis did not arise until 2012 (Department of Navy [DoN] 2015, Department of the Air Force 2012, United States Army Corps of Engineers [USACE] 2016). Sampling and analysis approaches for PFASs have evolved significantly over this era in response to a better understanding of materials that can introduce PFAS contamination, the nature of PFAS partitioning and distribution in different kinds of media, and the recognition that differences in both sampling and analysis techniques generated unacceptably high levels of variance in PFAS levels among split samples (Martin et al. 2004).

Some of the properties that make PFASs desirable for use in the materials and equipment related to sampling and analysis of other organic constituents – low retention of organic compounds, durability, and heat resistance – has led to their widespread use in sampling materials and laboratory equipment. Fluorinated tubing, pump bladders, bottles and lids, internal components, and tape are all commonly used in sampling equipment for other organic compounds such as chlorinated solvents. In the laboratory setting, the instrument most commonly used to measure PFASs, a liquid chromatography tandem mass spectrometry (LC-MS/MS) system, is routinely sold with fluorinated tubing and components. While most of these materials are comprised of fluoropolymers such as polytetrafluoroethylene (PTFE), the production of these materials often results in residuals of commonly measured PFASs that can leach into environmental samples at the sampling or laboratory stage. This issue is particularly acute in the case of samples that have been extracted into solvents containing a high organic (e.g., methanol, acetonitrile) percentage, which more rapidly leach PFAS residuals out of fluoropolymer tubing than aqueous solutions. Because of the potential for cross-contamination of PFASs from sampling and analysis equipment, significant precautions are taken to avoid PFAS contributions during sampling and in the laboratory setting.

The surfactant nature of many PFASs, particularly those of common environmental interest, also contribute to some of the challenges in collecting representative samples and measuring PFASs. While most PFASs are relatively water soluble, they tend to partition at air-water and water-solid interfaces (Brusseau 2018). This can result in biased analysis results related to sub-sampling of aqueous environmental samples, as well as retention of PFASs on sampling bottles. As PFASs are a large class of chemicals, there is also variance in how individual PFASs may exhibit these behaviors (Barzen-Hanson et al. 2017b). Some polyfluorinated compounds like the polyfluoroalkyl phosphates tend to partition more strongly to surfaces than the PFAAs (Chandramouli et al. 2015), and as the perfluoroalkyl chain lengthens in a molecule, the more hydrophobic binding potential a PFAS molecule exhibits (Higgins and Luthy 2006). PFASs with higher organic carbon or electrostatic partitioning affinities to soils can be more challenging to fully extract from soils and other solid samples (Sepulvado et al. 2011, Barzen-Hanson et al. 2017b). Sampling and analytical techniques have evolved to address these PFAS-specific challenges.

Sampling and analysis for PFASs are subject to some of the same challenges that occur in the environmental sampling and analysis of other organic contaminants. For example, cross-contamination related to sampling equipment and sampling order are concerns for PFASs and collecting a representative soil sample may present challenges for PFASs as it does for other contaminants, given the heterogeneity of soil samples. Some common challenges are less problematic when sampling and analyzing for PFASs. For example, most target PFASs of interest are not volatile and cross-contamination via air space in coolers is not typically a concern.

Laboratory detection limits for PFASs tend to be quite low (i.e., less than 10 parts per trillion [ppt] for aqueous and soil samples) and achieving necessary reporting limits is not often limited by sample size. While PFAS measurements can be partially inhibited by matrix interferences, the specificity of the detection methods for PFASs mitigate against incorrect identification. PFASs measured by LC-MS/MS are identified by retention time, molecular weight, and one or two specific molecular weight transitions to known product ions. As a result, co-eluting analytes have a very low likelihood of being misidentified as the target PFAS of interest. There are also many isotopically labeled versions of PFASs that can be added during sample preparation and analysis to account for losses associated with extraction

inefficiencies or matrix enhancements and suppression, resulting in a highly accurate sample quantification.

This white paper summarizes the current state of best practices for the sampling and analysis of PFASs in environmental media. It also provides an overview of the current U.S. regulatory landscape governing PFAS occurrence in environmental media.

2 SAMPLING METHODS AND PROCEDURES

This section provides a summary of methods and procedures applicable to the collection of environmental samples for field screening or laboratory analysis during PFAS site characterization activities. In general, sampling techniques used for PFAS site characterization are consistent with conventional sampling techniques used in the environmental industry, but special consideration is made regarding PFAS-containing materials and cross-contamination potential. For example, Teflon™ and other fluoropolymer containing materials are found in pumps, tubing, and sample storage containers and therefore should be avoided if possible (Department of Environment Regulation [DER], Western Australia 2016; New Hampshire Department of Environmental Services [NHDES] 2016). Certain field documentation materials such as waterproof paper or field books, adhesive paper products, and some writing utensils (grouped as non-Sharpie® markers) are also prohibited items during PFAS sampling (DER 2016; NHDES 2016). **Table 1a** provides a summary of materials that have been approved for site investigation; this list is expected to grow longer as industry experience increases. **Table 1b** provides a summary of field equipment and materials that have available testing information and/or industry knowledge regarding PFAS cross-contamination potential and it is recommended that these materials be prohibited for sample collection; for materials that are suspected of containing PFASs and/or to retain PFASs, these recommendations are considered preliminary and subject to change.

Given the extremely low detection limits associated with PFAS analysis and the many potential sources of trace levels of PFASs, field personnel are typically advised to err on the side of caution by strictly following field wear guidelines and decontamination procedures. A detailed summary of cross-contamination and decontamination procedures is provided in Section 4.

For example, further evaluation may be conducted in the form of pre-field equipment blank sample analysis.

2.1 Soil and Sediment Sampling Techniques

Conventional soil drilling and sediment sampling can generally be used to obtain samples for analysis of PFASs (DER 2016). For PFAS sample collection, it is recommended that samples are collected in laboratory supplied HDPE sample containers. Additional considerations for common sampling technologies and materials include the following:

- Hand auger and hollow stem auger samples may be collected in a split spoon or Shelby sample container. Both samplers may be lined with stainless steel, carbon, brass, or acetate sleeves. Samples may be collected from the soil core and placed in laboratory supplied sample containers, which is the preferred method for PFAS soil sample collection. Historically, samples have been collected in the sleeves and plastic caps were placed on the sleeve ends and sent for laboratory analysis. This practice is no longer considered advisable since most laboratories lack the proper tooling to extract soil from the sleeves.
- Direct push samples are typically collected in Lexan™ or acetate sleeves, or polyvinyl chloride (PVC) liners for dual-tube or Macrocore sampling. These materials are generally considered acceptable for

retrieving drilling cores for PFAS soil sample collection. Sample intervals may be cut using a cutting device and the sleeve can be capped and submitted to the laboratory. However, to limit laboratory sample processing, direct push soil cores should be split open and the soil samples collected into the laboratory supplied sample container.

- Rotosonic samples are collected from the core, which is retrieved in a plastic sleeve. Samples are typically collected directly into a laboratory supplied sample container and/or by using a trowel and placing the sample into the laboratory supplied sample container.
- Backhoe samples are collected from the bucket of the backhoe. Samples are typically collected directly into a laboratory supplied sample container and/or by using a trowel and placing the sample into the laboratory supplied sample container. For PFAS sampling, additional care should be taken to collect soil samples for PFAS analysis from the inner portion of large soil masses to obtain untouched soil for laboratory analysis, if such masses are observed during soil excavation.

Because of the potential presence of PFASs in equipment typically used to collect samples, consideration for other sampling materials that contact the soil cuttings through the sampling process is necessary. For example, a cutting shoe is used on the head of a direct push drill string and a bucket auger is used to collect samples from a test pit using a backhoe. Each piece of equipment that comes into direct contact with the soil cuttings needs to be evaluated to determine if there are either PFAS-containing materials present, which could be a source of cross-contamination and cause false positives, or if PFASs adhere to the material, which has the potential to cause low bias sample results. If there is concern that equipment may introduce contamination, a conservative number of equipment blanks should be collected to confirm that materials in the sample equipment do not cause false positives by introducing PFASs. Equipment blanks are particularly important for any device/component where PFASs may be present or cannot be verified as being a non-PFAS containing material. Other quality assurance methods may be implemented to avoid materials that could result in potential losses associated with PFASs adhering to surfaces. For example, collecting samples from an “undisturbed” portion of a large diameter soil core and transferring it to the laboratory supplied container may provide assurance that representative soil samples are collected for PFAS sample analysis.

The following additional notes are provided regarding soil sampling materials:

- Where drilling or decontamination water is needed it is recommended to submit water samples of the source water prior to investigation activities for PFAS analysis to enhance assurance that background PFASs will not be introduced. Note that some water systems may be constructed with PFAS-containing thread and gasket sealants and therefore an inspection of the source water distribution system may provide an additional level of assurance for identifying a source of PFAS-free water for site investigation.
- It is often standard practice to cover the ends of sample sleeves and protect the sample from potential cross-contamination from the plastic end caps with Teflon™ or other PTFE tape (Geotechnical Services, Inc. 2018); this practice should be strictly avoided for PFAS sample collection (DER 2016).
- Lexan™ liner sleeves are made of polycarbonate and they are not expected to contain PFASs based on review of the Safety Data Sheet (Sabic 2016).

- Acetate (i.e., cellulose acetate butyrate) liners are commonly used as sleeves and are not expected to contain PFASs.
- Studies evaluating the use of stainless steel indicate that PFASs do not strongly sorb to stainless-steel (Obal et al. 2012). Therefore, stainless steel sleeves and stainless-steel equipment should be acceptable for collection of soil samples for PFAS analysis.

2.2 Water Sampling Techniques

Groundwater samples for chemical analysis are commonly collected using the following sampling technologies and materials:

- Water levels are typically recorded prior to sample collection. For PFAS sample collection, it is recommended that water levels be measured following completion of sample collection to minimize the potential for cross-contamination between monitoring wells (USACE 2016). Site or project specific considerations may be considered when deciding the timing of water level collection.
- Grab groundwater samples may be collected by installing a Hydropunch™ type sampler or temporary monitoring well and collecting samples using a bailer, peristaltic pump, submersible pump (including bladder pumps). For PFAS sample analysis, collection of a conservative number of equipment blanks from the sampler or monitoring well materials may be appropriate to address concerns with potential cross-contamination (see **Table 1b**). Equipment blanks are particularly important for any device/component where PFASs may be present or cannot be verified as being a non-PFAS containing material.
- Groundwater samples may be collected from existing monitoring wells using purge and minimal to no-purge sampling techniques. It is recommended to use low-flow peristaltic pumps using silicone or HDPE tubing (DER 2016; MassDEP 2017). However, it will be necessary to use submersible pumps for sites with depth to groundwater greater than approximately 30 feet below ground surface. HDPE HydraSleeves™ or similar products may also be used for passive sampling (DER 2016; MassDEP 2017). The tether that is provided by HydraSleeve™ is made of polyester and is not expected to affect measured PFAS concentrations.
- Surface water samples may be collected using dipping, scooping, bailing, and pumping sample techniques. For PFAS sampling, it is recommended that active/grab sampling methods are used (e.g., Niskin™ or other remotely activated water samplers), or simply hand-dipping. Samples should not be collected from the surface (United Nations Environment Programme [UNEP] 2015).
- Porewater samples may be collected using a porewater extracting device or by collecting intact sediment cores and centrifuging porewater from the sediment core. Intact sediment cores may be frozen with dry ice and shipped on ice, if needed for project objectives. Most PFAS-analysis related guidance prohibits the freezing of samples prior to extraction indicating a need for additional consideration of sediment sampling techniques for PFAS sample collection. Additional consideration of sample freezing is provided in Section 4.5 for consideration. Regardless, when shipping and storing samples for PFAS analysis, it is important to avoid BlueIce™ (see **Table 1b**).

As described for soil and sediment sampling, the potential presence of PFASs in equipment that may come in contact with the target water sample must be evaluated as part of the sample planning process

to maintain sample integrity. For example, low-flow sampling with a peristaltic pump should be conducted using silicone or HDPE tubing, and Teflon™ tubing is prohibited (DER 2016). If a bladder pump is used to collect samples, the bladder and other internal parts (check balls, o-rings, compression fittings) should not be made of Teflon™ either, and bladder and o-rings should be changed between samples (DER 2016). **Tables 1a-1b** provide a summary of sampling materials and available information regarding the advisability of their use during PFAS sampling. Section 4.1 provides additional detail regarding cross-contamination considerations.

Other sampling bias potential may exist due to the nature of PFASs as surfactants. For example, at low concentrations, surfactant molecules exist in the monomer state in aqueous solution. As the surfactant concentration increases, they can reach a critical micelle concentration (CMC) and begin to self-associate to form a new pseudo-phase called a micelle (Adak et al. 2005). Micelle formation is very unlikely to occur in the nanograms per liter (ng/L)/ ppt to microgram per liter (µg/L)/ parts per billion (ppb) range of PFAS concentrations observed at moderate to highly contaminated PFAS sites, as most CMCs for PFASs occur in the milligrams per liter (mg/L) to grams per liter (g/L) range (Martin et al. 2003). Therefore, micelle formation is not of concern for collection of water samples for typical environmental site investigations. PFAAs also partition preferentially at the air-water interface (Moody and Field 2000, Brusseau 2018). There is very limited information regarding this potential sampling bias, though the following considerations provide a framework for avoiding stratification if it is an issue:

- A sample plan may incorporate a minimum three well casing volume purge (subject to stabilized field parameters) to enhance assurance that groundwater is not stagnant prior to collecting a groundwater sample. However, this practice should ideally be conducted in advance (i.e., a minimum of 24-hours) of sample collection to prevent contaminant flux-based recharge from affecting the sample result.
- Low-flow groundwater sampling techniques also have the potential to result in sample results representative of flux-based recharge (e.g., to be representative of groundwater in the coarse-grained materials in a monitoring well cross-section).
- No-purge passive sampling techniques (such as the HDPE HydraSleeve™) provide the opportunity to collect in-situ groundwater samples from within the screened interval of a monitoring well. This technique has historically been shown to provide more conservative (i.e., higher concentration) values for other types of contaminants than samples collected using well-volume purging, and values equivalent to samples collected using low-flow purging and sampling.

Regardless of the selected sampling technique, the current state of practice for groundwater sample collection is to collect water samples from the mid-point of the saturated well screen interval. There is not any compelling evidence to suggest the practice should be different for samples collected for PFAS analysis (Arcadis 2017).

Note that if high concentrations of PFASs related to Class B firefighting foams are expected in a groundwater sample, it has been recommended to collect and shake a small portion of the sample at the time of sample collection (USACE 2016; Arcadis 2017). If foaming is noted within the sample, it indicates elevated concentrations of PFASs may be present and the sample should be proactively diluted at the laboratory prior to analysis. The foaming should be noted on the sample chain of custody form.

2.3 Sample Shipping

Following sample collection, samples for laboratory analyses are commonly placed in a polyethylene bag (e.g., Ziploc©) and placed in an ice-chilled cooler for sample preservation. A temperature range between 0 and 6ºC is considered appropriate for PFAS sample preservation (United States Environmental Protection Agency [USEPA] 2009). As noted in **Table 1b**, reusable chemical or gel ice packs (such as BlueIce™) are strictly prohibited for PFAS sample storage or transport. Ice contained in polyethylene bags is recommended instead (DER 2016).

2.4 Investigation Derived Waste (IDW)

Investigation derived waste (IDW), including drill cuttings and groundwater purge water is typically placed in drums and temporarily stored on-site pending waste characterization. Typical waste characterization procedures include collection of a composite sample of the drill cutting material and a composite sample of the purge water for laboratory analysis. Samples are typically analyzed for disposal toxicity characteristic leaching procedure (TCLP) analysis for metals and volatile organic compounds. For PFASs, a simple leach test with neutral pH water may be more indicative of actual risk, as PFASs leach more strongly at neutral than acidic pH due to their acid dissociation constants (pKas). Additionally, generators of waste are required to include analysis of other constituents that are reasonably believed to be present, including PFASs if detected in analyzed samples.

In general, PFAS-containing IDW poses a unique challenge for disposal because acceptance of such waste will be based on the local facility and their permit restrictions. Prior to off-site disposal, it is necessary for responsible parties (or their representatives) to confirm that the facility is meeting the regulatory requirements for accepting waste containing PFASs. Facilities that provide high temperature incineration (i.e., hazardous waste incinerators) are likely to meet the necessary technical requirements for complete destruction of PFASs. Water treatment technologies that may be suitable for onsite or offsite treatment of aqueous IDW include granular activated carbon or non-ion/anion-exchange resins, but the system must be designed with proper consideration for PFAS treatment and the treatment media will also need to be disposed of. Prior to disposal, soil may be stabilized for PFASs using amendments that exploit both the hydrophobic and electrostatic properties of PFASs to help fix PFAS mass in place (fixation). To date, the long-term permanence of fixation for PFASs is yet to be demonstrated in the field, although there are projects underway in 2018 with the aim of comparing three commercially-available adsorbents and performance monitoring of leachability of PFASs over a period of three to four years. Additionally, several innovative treatment options for PFASs in soil and water are in development and some will likely be practical for on-site IDW treatment. A detailed discussion of IDW treatment technologies for PFASs is the subject of a forthcoming white paper.

3 ANALYTICAL METHODS

The most common instrumentation used to measure PFASs is LC-MS/MS. Because most PFASs are measured by this comparatively modern technique, they were not reported on in the peer-reviewed literature until the late 1990's, when researchers began to have access to this instrumentation (Moody and Field 1999, Giesy and Kannan 2001). In July 2004, prominent PFAS researchers wrote an editorial in Environmental Science and Technology entitled "Analytical Challenges Hamper Perfluoroalkyl Research" (Martin et al. 2004). The article argued for the need for additional certified analytical standards and stronger interlaboratory comparison of methods, two issues which have since been largely resolved. Van Leeuwen et al. reported on significant improvements in the analysis of PFASs through an interlaboratory comparison in 2009 (van Leeuwen et al. 2009). The first and only USEPA Method - USEPA Method 537 Version 1.1 - to measure PFASs was published in 2009, and it covers the analysis of fourteen individual PFASs in drinking water (**Table 2**). Notably other common PFASs of interest, including perfluorobutanoic acid (PFBA), perfluoropentanoic acid (PFPeA), and perfluorooctane sulfonamide (PFOSA) did not meet data quality objectives when this method was rigorously tested (USEPA 2009). The issuance of the Quality Systems Manual (QSM) 5.1 in January 2017 was the first governmental guidance that mandated certain analytical procedures for the analysis of PFASs in soil, sediment, surface water, and groundwater (U.S. DoD 2017). Commercial laboratories, under their DoD Environmental Laboratory Accreditation Program (ELAP) accreditation, must align their standard operating procedures (SOPs) with the requirements set forth in Table B-15 of QSM 5.1 (**Appendix A**), or later versions of the QSM to which the laboratory is accredited. These QSM 5.1 compliant methods for analysis of PFASs in environmental samples are typically referred to as modified 537 methods, but each lab uses a slightly different modified 537 method. Notably, DoD installations are required to use ELAP-certified laboratories for environmental analyses.

Since 2010, a proliferation in the number and type of PFAS analytes being measured has occurred. Some of these analytes are measured quantitatively with authentic analytical standards, some are measured semi-quantitatively with commercial materials (Place and Field 2012), and some are tentatively identified and estimated using high resolution techniques (Barzen-Hanson et al. 2017a, Strynar et al. 2015). Depending on the types of PFASs of interest and the media in which they are to be measured, different extraction methods, instrumentation tuning, and even instrument type may be used. In addition to the array of methods that have been developed to measure individual PFASs, several methods that measure either total organic fluorine or the total concentration of PFAA precursors have also been developed. This white paper addresses all of these analytical nuances, but primarily focuses on the sample preparation and analysis of discrete PFASs in environmental aqueous media and soil.

Table 2: List of PFAS Analytes Certified for Analysis Under USEPA Method 537.

Name	Abbreviation	Chemical Abstract Service (CAS) Number
Perfluorohexanoic acid	PFHxA	307-24-4
Perfluoroheptanoic acid	PFHpA	375-85-9
Perfluorooctanoic acid	PFOA	335-67-1
Perfluorononanoic acid	PFNA	375-95-1
Perfluorodecanoic acid	PFDA	335-76-2

Name	Abbreviation	Chemical Abstract Service (CAS) Number
Perfluoroundecanoic acid	PFUnA	2058-94-8
Perfluorododecanoic acid	PFDoA	307-55-1
Perfluorobutanesulfonic acid	PFBS	375-73-5
Perfluorohexanesulfonic acid	PFHxS	355-46-4
Perfluorooctanesulfonic acid	PFOS	1763-23-1
Perfluorotridecanoic acid	PFTrA	72629-94-8
Perfluorotetradecanoic acid	PFTeA	376-06-7
N-ethyl perfluorooctanesulfonamidoacetic acid	N-EtFOSAA	2991-50-6
N-methyl perlfuorooctanesulfonamidoacetic acid	N-MeFOSAA	2355-31-9

3.1 Sample Preparation

3.1.1 Isotope dilution

For many PFASs, an isotopically labelled form of the same compound is commercially available. This means that, for example, a PFOA molecule that has one or more carbons comprised of ^{13}C, rather than the predominantly occurring ^{12}C, can be procured. It is advantageous to add isotopically labelled compounds to either a raw or prepared sample because it will mimic the non-labelled (i.e., native) compound in how matrix effects impact the particular PFAS. If the labelled compound's response is quantified, it can be used to adjust the response of the native compound to improve the accuracy of quantification. This is a less arduous process than standard additions; however, the isotopically labelled compounds can be somewhat expensive to procure. It is important to note that the use of isotopically labelled compounds for any quantification purposes presupposes that the quantification method is based on mass detection. A detection technique such as ultraviolet (UV) absorbance or fluorescence cannot distinguish between two compounds with the same structure but slightly different masses.

The practice of quantifying a PFAS of interest using isotopically labelled surrogate compounds is called isotope dilution. When using isotope dilution, all samples analyzed are amended with the same amount of the labelled compound, including calibration standards. Typically, this means that calibration curves are prepared with an x-axis that is the compound concentration, and a y-axis that is the response of the native compound divided by the response of the labelled compound with which it is paired. If an exact match is unavailable, then a labelled compound that is a close structural match may be used instead.

Most methods developed by academic researchers (Sepulvado et al. 2011, Houtz et al. 2013, Backe et al. 2013) and QSM 5.1 (Table B-15 – **Appendix A**) stipulate the amendment of the isotopically labelled compounds to the sample prior to any sample preparation steps, so that the labelled compounds can also quantitatively capture any losses due to preparation steps like extraction. These extraction surrogates are then used for quantification of PFASs in the sample. In QSM 5.1, these compounds are called "Extracted Internal Standard Analytes" (U.S. DoD 2017). The use of extracted internal standards allow for the reporting of PFASs with lower absolute recoveries, although there are still constraints placed around minimum recoveries of PFASs in QSM 5.1 (between 50 percent [%] and 150% of their true value). In

USEPA Method 537 and the American Society for Testing and Materials (ASTM) methods for analysis of PFASs in soil and aqueous media, some isotopically labelled PFAS surrogates are included and separately tracked for recovery, but they are **not** used for quantification (USEPA 2009, ASTM 2014, ASTM 2015).

Isotopically-labelled compounds can also be added after method preparation steps to track instrument response consistency; these are usually called internal standards. In QSM 5.1, a select list of these additional isotopically labelled compounds, called “Injection Internal Standard Analytes”, are used for this purpose; they are not used for quantification, and they have a different number of labelled atoms than the Extracted Internal Standard Analytes (U.S. DoD 2017). In USEPA Method 537, an additional set of isotopically-labelled compounds are added after extraction and used for quantification (USEPA 2009). They are referred to as “internal standards” in this method.

Because instrument reliability is generally considered less problematic than potential matrix interferences, it is more accurate to quantify with the compounds that are added in advance of sample preparation (i.e., extracted internal standard analytes) rather than those added after sample preparation (i.e., injection internal standard analytes or the internal standards within USEPA Method 537).

3.1.2 Aqueous samples

The sample preparation of aqueous samples for PFAS analysis varies primarily in the amount of matrix cleanup deemed necessary.

PFASs are well known to stick to nylon and, to a lesser extent, glass particle filters (Chandramouli et al. 2015, Figure 1), so samples should not be pre-filtered prior to sub-sampling or extraction. The ASTM method for analysis of aqueous media for PFASs stipulates filtration of samples through a filter; however, the samples are diluted in a 50% methanolic solution prior to filtration (ASTM 2015). Most commercial laboratories centrifuge aqueous samples to remove particulate content prior to further extraction or analysis, if they suspect the particulates will cause analysis problems (personal communication with TestAmerica, Eurofins, and GCAL Laboratories). As with requirements to solvent rinse aqueous sample bottles, a solvent rinse of the centrifuge tube and its remaining particulate contents would help enhance removal of PFASs retained to the tube. If any particulate management steps are taken, isotopically labelled compounds should be added in advance of those steps to account for any associated losses. Management of particulates is not specified by USEPA Method 537, QSM 5.1, or laboratory accreditation standards.

The simplest sample preparation can involve the sub-sampling of an aqueous sample, addition of isotopically-labelled compounds, and subsequent instrumental analysis. Many peer-reviewed publications and the ASTM method for PFASs in aqueous media have used this technique, particularly to preserve sample volume for future analysis or if sample concentrations are known to be very high (Higgins et al. 2006, Backe et al. 2013, Houtz et al. 2013, ASTM 2015). It is generally not considered the best laboratory practice to analyze a partial sample. QSM 5.1 allows sub-sampling of AFFF formulations that will require dilution but does not allow sub-sampling of environmental aqueous samples unless they are known to contain PFASs at concentrations that will require dilution prior to analysis (e.g., samples that foam upon shaking or samples that are collected from a location previously characterized for PFASs). Isotopically-labelled extracted internal standard analytes are added to the sample prior to analysis rather than prior to sub-sampling for these types of high concentration samples (U.S. DoD 2017).

Solid phase extraction (SPE) is a technique of extracting target compounds from an aqueous sample onto a solid-phase cartridge that does not retain some matrix interferences. The SPE cartridge is then eluted with a much smaller volume of organic solvent to make the target compounds available for analysis, resulting in a more concentrated sample and, typically, lower quantification limits. SPE is specified by both USEPA Method 537 and QSM 5.1 for all aqueous samples that do not contain high levels (i.e., requiring dilution prior to analysis) of PFASs. Different SPE cartridges are available, automated in-line SPE coupled with instrumental analysis or offline manual SPE may be used, and the exact procedure for SPE can vary. The most commonly used types of SPE cartridges used to retain PFASs are C18 cartridges, which retain PFASs via hydrophobic interactions and are less effective at retaining short chain PFASs, and weak anion exchange cartridges, which retain PFASs through a combination of anion exchange and hydrophobic interactions. PFASs with positive charges that lack significant hydrophobic character may not be well retained on either type of cartridge. Liquid-liquid extraction, another extraction technique that can concentrate organic compounds, can also be used for PFASs but is generally less desirable due to the generation of large volumes of solvent waste.

Because there is concern over PFASs sticking to the sample bottle, some laboratory SOPs stipulate extraction of the entire sample, including a solvent rinsate of the sample bottle to remove any sorbed PFASs. USEPA Method 537 also requires whole bottle analysis and rinsate with solvent. Because a laboratory will use the entire sample, any re-analysis would require a backup sample in a separate bottle.

QSM 5.1 requires SPE solvent eluents to be further amended with an activated carbon type of product called ENVI-CARB,™ centrifuged, then transferred (i.e., the supernatant) to a new vessel prior to analysis. When PFASs are dissolved in an organic solvent such as methanol, ENVI-CARB™ will remove many interfering compounds but will not retain PFASs.

It is important to note that even with analysis following the guidelines of QSM 5.1, sample preparation procedures and analysis (e.g., SPE cartridges, extraction solvents, whole bottle analysis vs. sub-sampling, exact instrumental procedures) will vary somewhat from laboratory to laboratory. Accreditation processes and laboratory participation in round robin analyses enhance assurance that consistent performance is achieved among laboratories. A project may want to use a single laboratory to avoid inter-laboratory methodological variance.

An alternative PFAS extraction method for groundwater has been developed by Jennifer Field's laboratory at Oregon State University to effectively extract many AFFF-related PFASs that contain positive charges (Backe et al. 2013); this technique involves acidic liquid-liquid extraction of PFASs using ethyl acetate and 2,2,2-trifluoroethanol. This method is not commercially available and would only be necessary if positively charged PFASs are of particular analytical interest.

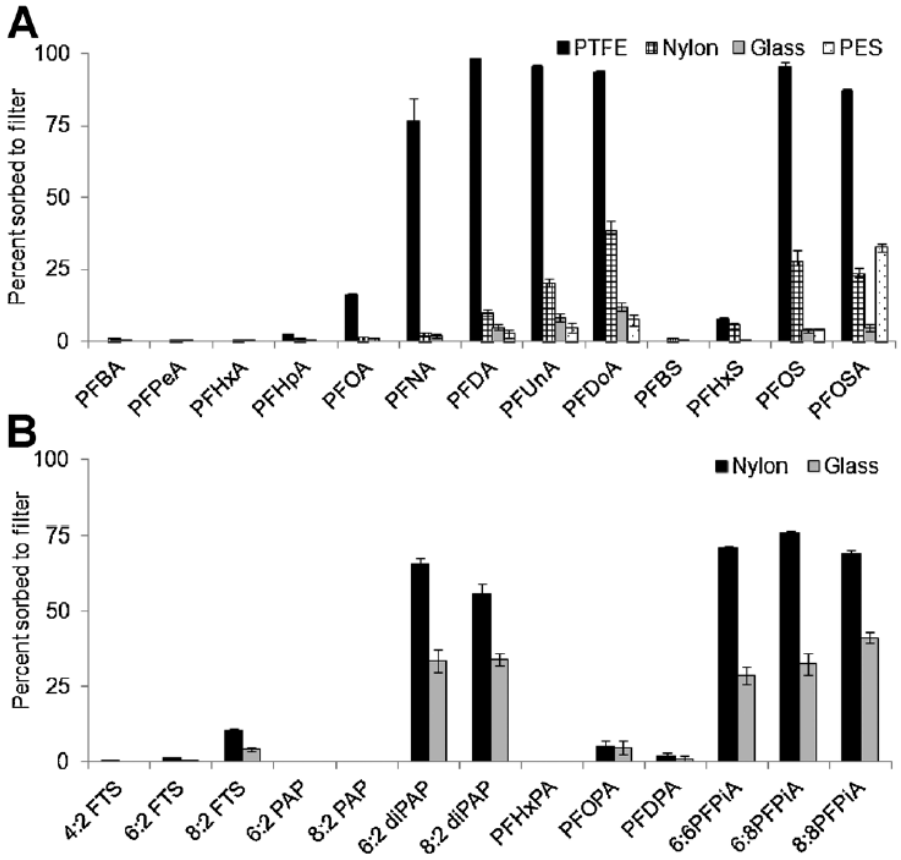

Figure 1: Sorption of per- and polyfluoroalkyl substances (PFASs) from spiked bottled water onto various filter media. (A) Sorption as percentage sorbed on filter for perfluoroalkyl carboxylic acids, perfluoroalkyl sulfonic acids, and PFOSA. (B) Percent sorbed for FTSs, monoPAPs, diPAPs, perfluoroalkyl phosphonic acids, and PFPiAs. Error bars represent standard error. (Figure copied from Chandramouli et al. 2015). PES = polyethersulfone. PTFE = polytetrafluoroethylene.

3.1.3 Solid Samples

Typical environmental solid samples analyzed for PFASs include soil, sediment, and biosolids. There are no USEPA methods governing the analysis of PFASs in these media, and QSM 5.1 does not provide any guidelines around soil and sediment preparation, apart from requiring homogenization of the entire sample and cleanup of the sample extract with ENVI-CARB^{TM}. There is a published ASTM method on analysis of PFASs in soil (ASTM 2014); however, some of its analytical requirements differ significantly from requirements set under QSM 5.1. Early soil preparation and analysis methods focused primarily on anionic PFASs such as the PFAAs and fluorotelomer sulfonates (FtSs) (Higgins et al. 2005, Sepulvado et al. 2011, Houtz et al. 2013). More recent methods have targeted a broader scope of analytes that include positively charged functional groups (Mejia-Avendaño et al. 2017, Barzen-Hanson et al. 2017b).

Prior to sample extraction, sieving of samples (finer than 2 millimeter pore size) to remove rocks and large particles is often conducted (Higgins et al. 2006, Sepulvado et al. 2011, Weber et al. 2017, Barzen-

Hanson et al. 2017b). Sample homogenization is also typically conducted, although methodological details are rarely provided (Higgins et al. 2006, Sepulvado et al. 2011, Houtz et al. 2013, Weber et al. 2017, Barzen-Hanson et al. 2017b, U.S. DoD 2017).

Most researchers report some type of serial methanolic extraction of solid samples, often conducted in conjunction with vortexing, heating samples between 30ºC and 60ºC, and sonication to improve efficiency of analyte desorption (Higgins et al. 2006, Sepulvado et al. 2011, Houtz et al. 2013, Mejia Avendaño 2017, Barzen Hanson 2017b, ASTM 2014). Isotopically labelled compounds are typically added to the solid sample to be extracted prior to or in conjunction with the addition of solvent extractant solutions. Many researchers have used the addition of either ammonium hydroxide (0.1% to 1%) (Houtz et al. 2013, Sepulvado et al. 2011, ASTM 2014) or, for more aggressive extractions of solid samples containing PFASs with betaine and quaternary ammonium functional groups, 200 mM sodium hydroxide (Mejia Avendaño et al. 2017). To extract zwitterionic and cationic polyfluorinated compounds found in some AFFF formulations, Barzen-Hanson et al. used an acidic methanolic extraction containing 0.1 M hydrochloride acid (2017b). For extraction of PFAAs and FtSs, basic methanolic extractions are sufficient (Houtz et al. 2013, Mejia Avendaño et al. 2017). For extraction of the widest range of PFASs on solids, both a basic and an acidic extraction is likely to be required (Barzen-Hanson et al 2017b). Extractions are conducted in centrifuge tubes containing an approximately 1 g to 10 mL soil to solvent ratio (Higgins et al. 2006, Sepulvado et al. 2011, Houtz et al. 2013, Mejia Avendano 2017, Barzen Hanson 2017b), and extracts are separated from the solids by removing the supernatant after centrifugation.

After extracts are collected and combined, the pH may be adjusted, and further cleanup is conducted prior to analysis with either SPE (Higgins et al. 2005) or ENVI-CARB™ (Sepulvado et al. 2011, Houtz et al. 2013, Mejia Avendaño 2017, Barzen-Hanson 2017b, U.S. DoD 2017). Cleaned up sample extracts are reconstituted in methanol or a mixture of methanol and water prior to analysis by LC-MS/MS.

Although no standard extraction method for PFASs in soil is stipulated by QSM 5.1 or an USEPA method, Table B-15 in the QSM 5.1 does stipulate specific recovery limits on extracted internal standard analytes and relative percent differences on matrix spike duplicates (U.S. DoD 2017). These limits offer a guarantee that individual laboratory SOPs with differing extraction procedures will generate defensible PFAS concentration data despite the lack of standard methodology. A project may want to use a single laboratory to avoid inter-laboratory methodological variance.

3.1.4 Other Matrices

Methods for the extraction and measurement of PFASs in other matrices beyond aqueous and environmental solids have also been developed but do not have published USEPA standard methods. A widely used method for measuring PFASs in blood and breast milk and developed by the United States Centers for Disease Control is reported in Kuklenyik et al. 2004. Briefly, it involves denaturing the protein content of samples with formic acid in an High Performance Liquid Chromatography vial, then proceeding through a typical LC-MS/MS method that includes online SPE. Other blood analysis preparation methods have included extraction with methyl tert butyl ether and an ion pairing reagent (Lee and Mabury 2011). A method for the determination of PFASs in dust has been reported by two USEPA researchers; fluorotelomer alcohols were extracted in hexane, subjected to SPE cleanup, and analyzed by gas chromatography (GC)-MS, while the PFAAs were extracted in acetonitrile and analyzed by LC-MS/MS (Strynar and Lindstrom 2008). Numerous methods have been published in the peer reviewed literature on

extraction and analysis of PFASs in biota, with van Leeuwen et al. comparing the efficacy of various extraction methods for fish tissue (2009). Like environmental solid samples, many methods for other matrices involve an extraction step with methanol or other organic solvent and cleanup with ENVI-CARB™.

3.1.5 Influence of Co-Contaminants

The influence of co-contaminants on the partitioning of PFASs has been investigated and published in the peer reviewed literature (Guelfo and Higgins 2013, Mejia Avendaño et al. 2017). Non-aqueous phase liquids (NAPL; dodecane and trichloroethene), amphoteric surfactants, and anionic surfactants generally increased sorption of PFAAs to soils (Guelfo and Higgins 2013); however, these effects were dependent on organic carbon fraction, PFAA chain length, and surface charge of soil. Guelfo and Higgins did not require any adjustments to their basic methanolic soil extraction procedures in the presence of these co-contaminants, as they did not interfere with the efficacy of the soil preparation techniques for PFAS measurement.

Mejia-Avendaño et al. 2017 noted slightly depressed recoveries for PFASs on soils in the presence of 40,000 parts per million (ppm) diesel; however, neither crude oil nor diesel spiked at 5,000 ppm or 40,000 ppm led to unacceptable recoveries of PFASs in contaminated soils (Figure 2). The type of PFAS had a much greater influence on method recovery than the presence of co-contaminants.

The influence of co-contaminants on PFAS extraction from groundwater samples has not been extensively reported. From laboratory preparation steps, it is not uncommon to see an SPE cartridge washed with a 10% or 20% methanolic rinse in water with no desorption of PFASs (van Leeuwen et al. 2009). Most organic co-contaminants occur at significantly lower concentrations in groundwater or surface water than 10% or 20% and have less affinity for PFASs as a solvent than methanol. Thus, organic co-contaminants are unlikely to interfere in groundwater preparation steps by prematurely desorbing PFASs from the SPE cartridge. Significant concentrations of organic carbon may preferentially sorb to SPE cartridges or cause matrix effects upon analysis. Similarly, samples with high concentrations of dissolved ions might diminish the anionic sorption capacity of PFASs to an SPE cartridge. However, isotope dilution and recording of isotopically-labelled standard recoveries can mitigate or identify the need for corrective actions if these effects occur.

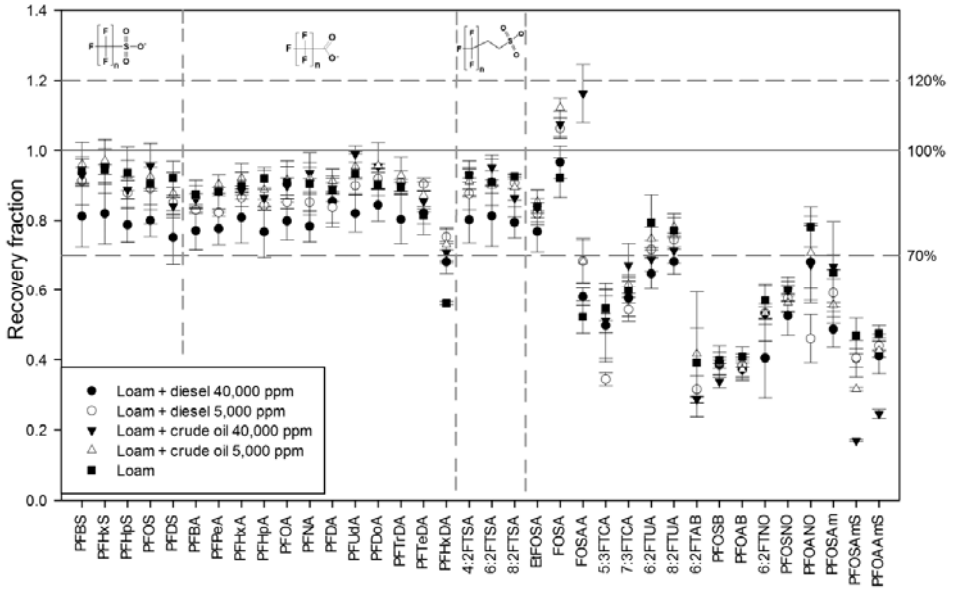

Figure 2: Recovery fraction of all studied PFASs in a loam soil with methanol/ ammonium hydroxide as extraction solvent in the presence and absence of hydrocarbon co-contaminants. Figure reproduced from Mejia Avendaño et al. 2017.

3.2 Instrumentation

LC-MS/MS is the instrumentation of choice for the measurement of most PFASs. The PFAAs are predominantly negatively charged at pH values greater than 3 to 5, so they are not amenable to GC, which is better suited for neutral, volatile molecules. The PFAAs do not fluoresce and do not absorb significantly within the UV/ visible (UV/vis) spectrum, so these types of detection methods are not suitable for PFAAs (Martin et al. 2004). The PFAAs, given their non-reactive nature, are also not easily derivatized (i.e., reacted with another compound) to molecules that are either volatile or possess UV/vis absorbing or fluorescing properties. As a result, liquid chromatography separation with mass spectrometry detection (LC-MS/MS) has become the de facto analysis choice for the PFAAs as well as many of the PFAA precursor or polyfluorinated compounds. An exception occurs for the measurement of volatile PFASs, including the fluorotelomer alcohols and the sulfonamide alcohols, which are most amenable to GC separation and analysis (Strynar and Lindstrom 2008). Notably, volatile PFASs are not intentionally included in AFFF formulations because they lack an ionic charge that is crucial to their functionality as surfactants.

Multiple types of MS detectors may be used, including single or triple quadrupole, ion trap, and time of flight. Single quadrupole, or LC-MS, is not considered sufficient to unequivocally identify compounds such as PFOS, as interfering compounds with similar elution times and the same nominal mass are often present in complex matrices. Thus, an MS detector that can fragment the parent molecule into one or more reproducible fragments is desirable for more specific and accurate identification of the correct PFAS. LC paired with triple quadrupole (LC-MS/MS) is most common due its cost (i.e., less expensive than time of flight instrumentation) and reliability for the range of PFASs of interest. LC-MS/MS for PFAS analysis is typically operated in negative electrospray ionization mode (Taniyasu et al. 2005 Higgins et al.

2005, Backe et al. 2013, Houtz et al. 2013, U.S. DoD 2017), which allows negatively charged PFAS molecular ions to pass through the MS. Occasionally, for the case of certain positively charged PFASs that are found in AFFF, positively charged electrospray ionization is used. In both USEPA Method 537 and QSM 5.1, LC-MS/MS analysis is stipulated for PFASs. LC-MS/MS analysis of PFASs is widely available in U.S. commercial laboratories, including in a mobile laboratory context offered by the company Cascade.

When analyzing PFASs by LC-MS/MS, some compounds will resolve as two individual or attached peaks (**Figure 3**). One peak is representative of the aggregate branched structural forms of the compound and the other peak is representative of the linear form of the compound. Historically, some laboratories have only quantitated the linear peak. It is now standard practice and required by QSM 5.1 and the 2016 USEPA 537 Technical Advisory, to quantitate both peaks when reporting the total concentration of any PFAS (U.S. DoD 2017, USEPA 2016).

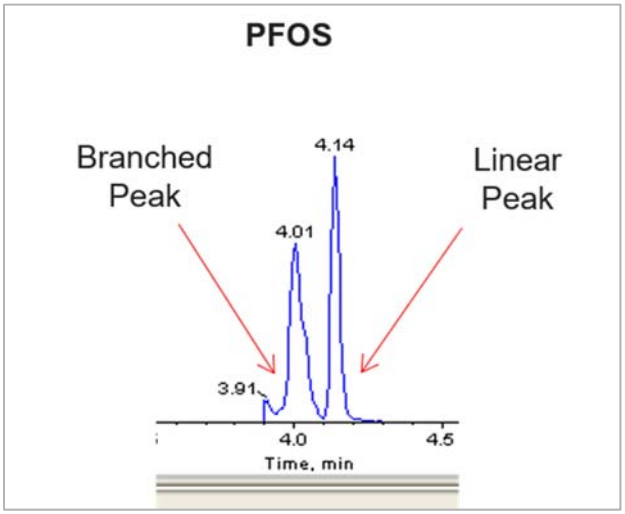

Figure 3: Branched and linear peaks of PFOS on an LC-MS/MS chromatogram.

Many LC-MS/MS instruments are sold with PTFE tubing and PTFE-coated components that can leach PFASs, particularly in the presence of organic solvents like methanol and acetonitrile. To avoid contamination of sample measurements with PFAS contributions from the instrument itself, tubing in the instrument is often replaced with stainless steel or polyetheretherketone tubing, where it is accessible (Houtz and Sedlak 2012, Roberts et al. 2017). Because all PTFE-based components can rarely be replaced, an LC column that either traps or delays the PFASs from the instrument is often placed after the LC pump. By delaying the PFAS responses from the instrument itself, the peak associated with the sample can be separated from the peak associated with the instrument's background contamination (Roberts et al. 2017).

For alternative methods that assess total PFAS concentrations, multiple other types of instrumentation may be used. The Total Oxidizable Precursor Assay, which converts polyfluorinated compounds to PFAAs, uses LC-MS/MS (Houtz et al. 2013). For methods that measure total organofluorine, detection of combusted organofluorine with ion chromatography is used in the adsorbable organofluorine or total organofluorine methods (Yeung et al. 2008), and particle induced gamma ray emission (PIGE) spectroscopy is used to measure isolated organic content containing fluorine (Ritter et al. 2017). All three

of these methods are available commercially on a limited basis. For tentative identification of PFASs for which analytical standards are unavailable, an MS technique that can measure exact or accurate mass (i.e., 498.9302 vs. a nominal mass of 499) is required to constrain the number of empirical formulas of the parent and product ion (Newton et al. 2017, Barzen-Hanson 2017a); accurate mass measurement and structural prediction is available commercially and through some academic labs. Fluorous membrane-based ion selective electrodes have been used for field measurement of aggregate PFASs in groundwater (Chen et al. 2013) and are offered for PFAS analysis by a single company commercially. These methodologies would be most appropriate when a detailed source characterization effort is needed or when evaluating the longevity and dosing of site-specific PFAS remediation strategies. Additionally, a recent release of PFASs that is unlikely to contain PFOS, PFOA, or PFASs targeted by QSM 5.1 or USEPA 537, such as a release from a currently manufactured, fluorotelomer-based AFFF, may be identified with one of these alternative techniques.

4 PROCEDURAL CONSIDERATIONS

4.1 Cross-Contamination

In addition to typical best practices for field sampling of environmental media, several guidance documents specify stringent precautions regarding the use of consumer care products, technical field gear, and equipment during PFAS sample collection processes. A detailed summary of cross-contamination related to sampling equipment is summarized in Section 2. As discussed, it is important to recognize that Teflon™ and other fluoropolymer containing materials are found in pumps, tubing, and sample storage containers and therefore should be avoided if possible (DER, Western Australia 2016; NHDES 2016). As such, as a basic consideration, it is important to use appropriate laboratory supplied sample bottles that are PTFE-free (including avoiding Teflon® or PTFE- lined lids on containers). There are additional detail for consideration regarding cross-contamination considerations for personal care products including health and safety considerations, food packaging, and collection of samples during a large rain event is provided below.

4.1.1 Personal Care Products

For PFAS sampling, the general recommendation for field personnel is to avoid using personal care products such as cosmetics, moisturizers, hand cream, sunscreen, and other non-essential products (USACE 2016; MassDEP 2017). Exemptions are allowed for medically necessary products, or the use of sunscreen and insect repellent required for health and safety reasons. A list of approved products is provided in the NHDES Perfluorinated Compound Sample Collection Guidance (2016). Where personal care products must be used, best practices apply, including applying any products prior to initiating field sampling at a safe distance away from the sampling locations and equipment (i.e., more than 10 meters away) and washing hands after application, prior to donning new gloves.

PFASs are also commonly found on coated textiles including waterproof fabrics, stain resistant fabrics, water resistant fabrics, and performance wear under brand names such as Gore-Tex®. Several PFAS sampling guidance references prohibit the use of outdoor performance wear that is water or stain resistant, or appears to be, and recommend that sampling personnel wear pre-laundered (multiple

washings, i.e., 6+) clothing that is made of natural fabrics such as cotton (USACE 2016; NHDES 2016). Synthetic fabrics may also be acceptable if there is no indication on the label that the fabric is water and stain resistant (NHDES 2016; Arcadis 2017). Further consideration regarding fabric used on the field vehicle seats, which may be treated with stain resistant products, has prompted the recommendation that the seats of the vehicle be covered with a well laundered cotton blanket for the duration of the field program (USACE 2016). Fabric softeners are also suspected as providing a potential source of PFAS cross-contamination (NHDEH 2016; MassDEP 2017).

These stringent practices may not be necessary if contact between field personnel's clothing and personal care items are avoided with sampling equipment, bottles, and/or samples. However, these personal care measures are currently standard practice for PFAS sample collection and should be followed until further information documenting their lack of utility becomes available.

4.1.2 Personal Protective Equipment

Some types of safety products including footwear, disposable coveralls, and safety gloves are manufactured with PFASs. For example, safety footwear may be treated to provide a degree of waterproofing and increased durability, and this represents a potential source of trace PFASs during field work. Guidance documents prohibit boots with Gore-Tex® or other synthetic water-resistant and/or stain-resistant materials by personnel conducting sampling (DER 2016; NHDEH 2016; MassDEP 2017). It is also well documented that leather may be treated with tanning products that likely also contain PFASs (UNEP 2012), indicating limited options for safety boots that do not definitively contain trace levels of PFASs. For the health and safety of field personnel, feet must be protected with safety shoes (Occupational Safety and Health Administration standard 1910.136(a)). Additionally, if proper handling procedures are implemented during sample collection, it is reasonable to assume that safety footwear will not cause cross-contamination issues during field sampling programs. Therefore, the following recommendations are incorporated into the USACE Standard Operation Procedure for PFAS Field Sampling (USACE 2016) and Arcadis' Technical Instruction Guidance for PFAS sample collection (Arcadis 2017):

- Personnel must not touch safety footwear in the immediate vicinity of the sampling location (i.e., within 10 meters).
- Personnel must not allow gloves used for sampling to come in contact with safety footwear.

Another precautionary measure relates to the use of coveralls. In general, common coveralls in the environmental industry include Tyvek® and poly-coated suits to protect against dirt and potential exposure to chemicals. Waterproof chest waders may also be needed for special field applications. The potential for PFASs to be used to coat these coveralls is considered likely given their water and chemical resistant applications. Therefore, special care and consideration is necessary if coveralls are needed. Some PFAS sampling guidance limits the list of acceptable substitutions to clothing made of synthetic fabric and/or cotton (NHDEP 2016; MassDEP 2017). However, this would not adequately protect workers if Level C protection is required. Therefore, it may not be possible to completely avoid the use of these materials, even if these common materials are generally restricted.

Safety gloves are one of the few safety products that serve the dual purpose of worker protection and sample protection. It is unavoidable that personnel will use their hands to collect environmental samples. Some safety gloves are manufactured with PFASs (e.g., Vitron®). In most cases, it is recommended that

field personnel wear disposable nitrile gloves at all times, and to don new gloves as field activities transition from decontamination, sampling, note taking, handling of equipment and field blanks, contact with sample bottles, and when judged necessary by field personnel (USACE 2016; Arcadis 2017). If other safety gloves are necessary for worker protection, a thorough review of the glove materials should be undertaken to avoid any types that may contain PFASs.

Safety measures must take priority during any sampling event, and sample procedures and guidance may need to be adjusted to account for potential cross-contamination from health and safety products. The inclusion of additional quality control samples such as equipment blanks will help assess the extent to which PFAS cross-contamination is introduced from unavoidable PFAS-containing field gear.

4.1.3 Food Packaging

Some food packaging may be treated with PFAS-containing chemicals to prevent permeation of oil and water in the food outside of the packaging (Schaider et al. 2017). To avoid potential food packaging-related PFAS contact, it is recommended that pre-packaged food, fast food wrappers or containers should not be used by the personnel conducting sampling at the sampling site (DER 2016; MassDEP 2017). Alternative products such as rigid plastic containers or bags or stainless-steel containers may be used to bring food to the site (DER 2016). It is also recommended that personnel wash their hands after eating and prior to resuming work after taking a food break. Other additional measures could include removing field garments or outer layers prior to eating and putting them back on after hands are washed.

4.1.4 Rain Events

Due to concerns with cross-contamination from use of waterproof materials, it is recommended that personnel avoid sampling during rain if possible (DER 2016). Potential cross-contamination from rain that may contain background levels of PFASs is also avoided by following the restriction for working in the rain. If necessary, sampling may continue during rain conditions with the use of polyethylene (e.g., disposable LDPE), vinyl, or PVC clothing and rain gear (DER 2016). A gazebo tent could also be erected over the work area to provide shelter from the rain (USACE 2016). The canopy material may be a PFAS-treated surface and should not be handled when collecting samples (USACE 2016; Arcadis 2017).

4.2 Decontamination

Detergents and decontamination solutions (e.g., Decon 90® Decontamination Solution) are prohibited for all equipment decontamination when conducting PFAS site investigations (DER 2016; NHDES 2016; MassDEP 2017). Alternative decontamination measures appropriate to equipment being used to sample PFASs include a water-only decontamination approach with PFAS-free water (DER 2016), and Alconox®, Liquinox®, or Citranox® followed by a deionized water rinse (USACE 2016; NHDEP 2016; MassDEP 2017).

Use of an organic solvent including methanol, isopropanol, or acetone for decontamination is also recommended for collection of water samples (UNEP 2015; USACE 2016). Use of methanol for field decontamination may be desirable as it provides additional confidence that decontamination procedures are effective; however, it may not be practical under all circumstances. Based on experience, ordering and storing significant quantities of laboratory grade methanol is challenging. Methanol is also extremely

flammable and burns with an invisible flame (Methanex 2008). While they are less typical solvents used for PFASs, isopropanol or acetone can also significantly enhance the decontamination of PFASs from sampling materials compared to water and would also result in fewer safety concerns than methanol.

Other decontamination protocols that are recommended include frequently replacing nitrile gloves (DER 2016), and repeating decontamination steps on field equipment that is used on highly contaminated soil and groundwater sampling.

4.3 Collection of Representative Background Samples

Due to their widespread uses, PFASs are detected relatively ubiquitously in the environment at low concentrations (i.e., single digit ppt and lower). It may be appropriate to sample for upgradient background concentrations of PFASs during site investigation to compare with concentrations present in and downgradient of suspected source areas. It may also be desirable to consider a statistical background sampling program if a risk assessment for the site is anticipated. When characterizing background levels of PFASs, the areas sampled need to represent areas that would be clearly unaffected by specific releases related to the areas of interest, or any other potential AFFF or other PFAS-containing material handling or disposal practices. If potential upgradient PFAS sources are identified during the desk top evaluation in preparation for field investigation, it may also be appropriate to sample the upgradient property boundary for PFASs.

4.4 Types of Quality Control Samples

Best practices for quality control sampling during PFAS site investigation includes daily collection of equipment blanks using laboratory-supplied “PFAS-free” water, field reagent blanks (i.e., transfer of PFAS-free water from the laboratory supplied reagent blank to an empty sample bottle), and field duplicate samples. A conservative number of separate equipment blanks may be collected from any equipment that is likely to be in contact with the sample such as new tubing, deconned bladder pumps, soil sample liners, drilling equipment (e.g., geoprobe cutting shoes), and temporary or permanent well materials. It is also appropriate to collect equipment blanks if certain equipment maintenance requirements introduce new products in the middle of the sample event (i.e., using a lubricant on the drilling equipment between boreholes). Equipment blanks are particularly important for any device/component where PFASs may be present or cannot be verified as being a non-PFAS containing material.

Regarding duplicate sample collection, typical industry practice includes collection of a minimum of one field duplicate per day or per sampling event, or one per 10 to 20 samples collected during a single field sampling event. In the case of PFAS site investigation, practitioners should prepare for a higher frequency of duplicate samples (i.e., greater than 10%) as it provides a very powerful level of confidence when evaluating unexpected elevated sample results. Use of blind duplicates and split samples provides assurance to investigation teams that their data is representative of site conditions. Additional assurances are provided from use of mobile laboratories where samples remain on-site and can be re-analyzed immediately if sample results do not sufficiently meet the data quality requirements of the project. It may be reasonable to collect several duplicate samples and place them on-hold and analyze as needed, if confirmation is necessary to make appropriate project decisions. For aqueous samples that require whole

bottle analysis, backup samples will not be available at the laboratory unless it is submitted in a separate bottle.

QSM 5.1 requires the inclusion of matrix spikes and matrix spike duplicates for groundwater, surface water, soil, and sediment analysis (U.S. DoD 2017) at a rate of one each per preparatory batch. Additional samples to accommodate these matrix spikes will need to be collected.

4.5 Hold Times

For PFAS analysis in drinking water, hold times are specified as part of USEPA method 537 (USEPA 2009). Fourteen days are permitted from sample collection to extraction, and an additional 28 days are permitted from extraction to analysis, with aqueous samples stored unfrozen between 0 and 6ºC. For PFAS analysis in soils and aqueous media, the ASTM methods permit 28 days from sample collection to sample analysis (ASTM 2014, 2015); however, both methods explicitly state that they did not conduct any hold time studies when setting those hold times. Some commercial laboratories follow a 14-day hold time for soils, and some follow a 28-day hold time. QSM 5.1 does not specify any specific hold times or temperatures for PFAS analysis of soils or groundwater (U.S. DoD 2017).

Most likely, 14 to 28-day hold times are overly conservative, particularly if, in the case of aqueous samples, the entire sample is analyzed and the bottle is rinsed. Jennifer Field's laboratory has retained frozen groundwater samples from military bases over more than a decade and re-analyzed them with similar results (Moody and Field 2002, Schultz et al. 2004, Backe et al. 2013). AXYS-SGS in British Columbia, Canada has conducted stability studies on reagent water samples spiked with PFASs over 90 days in amber glass, HDPE, and polypropylene containers (Kaiser et al. 2009). All losses of PFAAs were due to recoverable sorption on sample containers (i.e., not degradation) and notably, despite current sampling recommendations to avoid glass, losses on amber glass containers were less than on either type of plastic container. A solvent rinse of the aqueous sample bottle will thus mitigate against losses due to increased hold times to sample vessels. For solid samples, PFAS analytes are more likely to be retained within the soil sample than preferentially partition to the sample vessel.

Additionally, there is no expectation that the PFAAs will break down in either soil or groundwater considering their stability to microbial transformation and sunlight (Vecitis et al. 2009). PFAA precursors may slowly form additional PFAAs in storage, but their transformation rates will be depressed at typical storage temperatures compared to ambient conditions at many sites. The rates of precursor transformation have not been quantified under storage; however, PFAA precursors have been observed to persist at least partially in groundwater and soil at military bases over decades after their release, so they are not likely to transform significantly under typical laboratory hold times (Backe et al. 2013, Houtz et al. 2013).

5 STATE AND FEDERAL STANDARDS

Tables 3 through 5 summarize proposed and promulgated regulatory and guidance values in the U.S. for PFASs in drinking water, soil, and groundwater. A full list of PFAS standards for the U.S. in drinking water, soils, and groundwater are included in **Appendix B**, including weblinks.

In drinking water, the most commonly regulated analytes are PFOS and PFOA, followed by PFBS, PFNA, and PFHpA. GenX, a manufacturing processing aid that Chemours used to replace PFOA, is also currently regulated in drinking water in North Carolina. PFOS and PFOA are often regulated as a summation in drinking water, following the USEPA lifetime Health Advisories. Connecticut also regulated five PFASs in drinking water as a summation. USEPA has issued Risk Based Screening Levels (RBSLs) for PFOA, PFOS, and PFBS in residential tap water.

In soils, the most commonly regulated analytes are PFOS and PFOA, followed by PFBS and PFBA. USEPA has issued soil RBSLs for PFOA, PFOA, and PFBS under multiple exposure scenarios. Texas regulates the most individual PFASs – up to sixteen – in soils under multiple exposure and release scenarios.

In groundwater, the most commonly regulated analytes are PFOS and PFOA, followed by PFBS, PFBA, and PFNA. The USEPA Health Advisories for PFOS and PFOA drinking water are applied in some states to protection of groundwater. As with soil, Texas regulated up to sixteen individual PFASs in groundwater under multiple exposure and release scenarios.

Table 3: U.S. Standards and Advisory Values for PFASs in Drinking Water (abridged). Full tables are included in Appendix B. Values in parentheses are regulated as a summation of two or more PFASs.

Rhode Island		(70)		(70)		Groundwater Quality Standard	2017	Promulgated
Texas	100000	1700	1700	880	880	Protective Concentration Level (PCL)- Industrial, Ingestion	2017	Proposed
Texas	34000	560	560	290	290	PCL - Residential, Ingestion	2017	Proposed
Texas	100000	1700	1700	880	880	Risk-Based Exposure Limit (RBEL) - Commercial, Ingestion	2017	Proposed
Texas	34000	560	560	290	290	RBEL - Residential, Ingestion	2017	Proposed

*Promulgated in this table means there is a regulation or advisory value, but it may not meet the definition of promulgated under CERCLA.
ng/L = nanograms per liter; PFBS = perfluorobutanesulfonic acid; PFOS = perfluorooctanesulfonic acid; PFHpA = perfluoroheptanoic acid; PFOA = perfluoroctanoic acid; PFNA = perfluorononanoic acid; PFHxS = perfluorohexanesulfonic acid; PCL = Protective Concentration Level; RBEL = Risk-Based Exposure Limit

6 RECOMMENDATIONS

6.1 Soil and Groundwater Sampling Techniques

Soil and groundwater sampling techniques for PFAS sample collection will typically follow industry standards with special considerations related to the sampling materials and their compatibility with PFASs. Material compatibility for PFASs is of greater concern than specific procedures.

The following provides a summary of recommended sampling procedures, as documented in the literature:

- HDPE and, to a lesser extent, polypropylene sampling materials and containers are recommended (USEPA 2009; DoN 2015).
- The use of glass sampling containers is not recommended as PFASs adhere to the surface of glass (USEPA 2009). Data from AXYS-SGS suggests that glass sample containers may actually sorb PFASs less than HDPE or polypropylene; however, industry practice is still to avoid the use of glass sampling containers.
- Teflon™ (or other PTFE) materials should be strictly avoided for PFAS sample collection (DER 2016).
- Samples should not be filtered in the field or in the laboratory, as most types of filters retain PFASs (UNEP 2016; Chandramouli et al. 2015). Centrifugation, followed by combining a solvent rinse of the particulate-containing centrifuge tube with the sample, is recommended to remove particles in turbid aqueous samples at the laboratory.
- All disposable sampling materials should be treated as single use and disposed of appropriately after sampling.

Awareness for potential cross-contamination due to personal care, food packaging, and during rain events is necessary to prevent unnecessary sources of PFASs to the sampling process and minimize the potential for cross-contamination. Additionally, the following precautions are recommended during PFAS site investigation to avoid cross-contamination during sampling procedures.

- Plastic sheeting (preferably HDPE) may be placed adjacent to the work area to use as a clean work area, if conditions allow. Otherwise, measures need to be taken to protect sampling equipment from contacting the ground or other surface that could compromise sample integrity.
- Trowels or drilling equipment that will come into contact with a sample should be decontaminated prior to sample collection (see Section 4);
- HDPE sampling containers should be provided by the laboratory in the volume commensurate with sample analysis and limit of quantification and/or limit of detection requirements.
- Caps should be retained on the sample bottles until immediately prior to sample collection.
- Additional duplicate samples may be collected as backup if the laboratory conducts whole bottle analysis.

Consistent with best practices to prevent cross-contamination among reusable equipment, groundwater samples should be collected in a pre-determined order from least impacted to most impacted based on previous analytical data or knowledge about past activities at the site. Additionally, because PFASs are detected at background levels in the environment, consideration for characterizing background levels at sites is recommended.

6.2 Quality Assurance and Quality Control

- The relevant quality assurance/quality control guidelines for both PFAS sampling and PFAS analysis conducted at DoD installations should be stipulated in a Quality Assurance Project Plan following the Uniform Federal Policy and a DoD ELAP-accredited lab should be selected to conduct the PFAS analysis.
- Equipment blanks should be included for all types of reusable equipment that has direct contact with samples, especially for any device/component where PFASs may be present or cannot be verified as being a non-PFAS containing material. Field reagent blanks, in which laboratory provided PFAS-free water is decanted into a new container at the field site, are also recommended.
- Matrix spike and matrix spike duplicates are required by QSM 5.1 and should be included for all soil, groundwater, surface water, and sediment samples.
- Duplicate samples should be included at a rate of one per site or one per every ten to twenty samples per media, whichever is more frequent.
- Multiple bottles of highly sensitive aqueous samples should be sent to the laboratory in the event that re-analysis is required, as most laboratories analyze the entire sample bottle during the first analysis.
- The laboratory conducting PFAS analysis is required by QSM 5.1 and USEPA Method 537 to include a laboratory control sample and method blank per preparatory batch.

6.3 Analytical Methods

- No USEPA Methods are available for PFAS analysis in groundwater, surface water, sediment, and soil. Until USEPA methods become available and are accepted by the Army, analysis for PFASs in environmental samples should be conducted according to modified 537 methods that are accredited for QSM 5.1 Table B-15, or later version as determined by laboratory's accreditation schedule.
- USEPA Method 537 may be used to analyze for PFASs in drinking water. A QSM 5.1-compliant modified 537 method may be used for drinking water samples if it also follows the procedures around hold times, whole sample analysis, and other areas that are specified by USEPA 537 but left open ended by QSM 5.1. QSM 5.1- methodological procedures may be desired for drinking water if a longer PFAS analyte list is needed, e.g., if analysis of PFBA, PFPeA, or 6:2 FtS is desired. QSM 5.1 also employs isotope dilution, which is the most accurate form of targeted PFAS quantification.
- Serial basic methanolic extractions are used by most researchers and commercial laboratories for analysis of PFASs in soils and other environmental solids. These methods are acceptable for PFAAs and FTSs.

- If an extensive PFAS analyte list or a total PFAS measurement is desired for sample analysis, alternative methods are available but are likely not governed by a laboratory's QSM 5.1 ELAP scope of accreditation or a USEPA method. A laboratory that is accredited for such methods by a DoD-approved accrediting body should be employed for the analyses. Alternatively, an academic laboratory may be used if the analysis is for research purposes. These analyses are not recommended unless characterizing a source area in detail, designing a remediation strategy, or identifying a recent release unlikely to contain the PFASs measured by a laboratory's QSM 5.1 ELAP scope of accreditation or a USEPA method.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Aqueous Sample Preparation	Each sample and associated batch QC samples.	Solid Phase Extraction (SPE) must be used unless samples are known to contain high PFAS concentrations (e.g., AFFF formulations). Inline SPE is acceptable. Samples of known high PFAS concentrations can be prepared by serial dilution instead of SPE, with documented project approval.	NA.	NA.	NA.
Soil and Sediment Sample Preparation	Each sample and associated batch QC samples.	Entire sample received by the laboratory must be homogenized prior to subsampling.	NA.	NA.	NA.
Sample Cleanup Procedure using ENVI-Carb™ or equivalent	Each sample and associated batch QC samples. Not applicable to AFFF formulation samples.	Removal of interferences from matrix.	NA.	Flagging is not appropriate.	Cleanup should reduce bias from matrix background.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Mass Calibration	Initially prior to use and after performing major maintenance, as required to maintain documented instrument sensitivity and stability performance.	Calibrate the mass scale of the MS with calibration compounds and procedures described by the manufacturer. Entire range needs to be mass calibrated.	NA.	Flagging is not appropriate.	NA.
Tune Check	When the masses fall outside of the ±0.5 amu of the true value (as determined by the product ion formulas).	Mass assignments of tuning standard within 0.5 amu of true value.	Retune instrument and verify. If the tuning will not meet acceptance criteria, an instrument mass calibration must be performed and the tune check repeated.	Flagging is not appropriate.	No samples shall be analyzed without a valid tune.
Mass Spectral Acquisition Rate	Each analyte, Extracted Internal Standard Analyte, and Injection Internal Standard Analyte.	A minimum of 10 spectra scans are acquired across each chromatographic peak.	NA.	Flagging is not appropriate.	NA.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Calibration, Calibration Verification, and Spiking Standards	All analytes.	Standards containing both branched and linear isomers must be used when commercially available. If not available, the total response of the analyte must be integrated (i.e., accounting for peaks that are identified as linear and branched isomers) and quantitated using a calibration curve which includes the linear isomer only for that analyte (e.g., PFOA).	NA.	Flagging is not appropriate.	Standards containing both branched and linear isomers are to be used during method validation to ensure the total response is quantitated for that analyte. Technical grade standards cannot be used for quantitative analysis.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Ion Transitions (Parent-> Product)	Prior to method implementation.	The chemical derivation of the ion transitions, both those used for quantitation and those used for confirmation, must be documented. Two transitions and the ion transition ratio per analyte shall be monitored and documented with the exception of PFBA and PFPeA. In order to avoid biasing results high due to known interferences for some transitions, the following transitions must be used for the quantification of the following analytes: PFOA: 413 —› 369 PFOS: 499 —› 80 PFHxS: 399 —› 80 PFBS: 299 —› 80 4:2 FTS: 327 —› 307 *(continued next page)*	NA.	Flagging is not appropriate.	NA.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Ion Transitions (Parent-> Product) *(Continued)*		6:2 FTS: 427 —› 407 8:2 FTS: 527 —› 507 NEtFOSAA: 584 —› 419 NMeFOSAA: 570 —› 419 If these transitions are not used, the reason must be technically justified and documented (e.g., alternate transition was used due to observed interferences).			

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Initial Calibration (ICAL)	At instrument set-up and after ICV or CCV failure, prior to sample analysis.	The isotopically labeled analog of an analyte (Extracted Internal Standard Analyte) must be used for quantitation if commercially available (Isotope Dilution Quantitation). If a labeled analog is not commercially available, the Extracted Internal Standard Analyte with the closest retention time to the analyte must be used for quantitation. (Internal Standard Quantitation) S/N Ratio: ≥ 10:1 for all ions used for quantification. For analytes having a promulgated standard, (e.g., HA levels for PFOA and PFOS), the qualitative (confirmation) transition ion must have a S/N Ratio of ≥ 3:1. *(continued next page)*	Correct problem, then repeat ICAL.	Flagging is not appropriate.	No samples shall be analyzed until ICAL has passed. Isotope Dilution or Internal Standard Calibration is required for all analytes. External Calibration is not allowed. Calibration can be linear (minimum of 5 standards) or quadratic (minimum of 6 standards); weighting is allowed.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Initial Calibration (ICAL) *(Continued)*		The %RSD of the RFs for all analytes must be <20%. Linear or non-linear calibrations must have $r^2 \geq 0.99$ for each analyte. Analytes must be within 70-130% of their true value for each calibration standard.			

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Instrument Sensitivity Check (ISC)	Prior to analysis and at least once every 12 hours.	Analyte concentrations must be at LOQ; concentrations must be within ±30% of their true values.	Correct problem, rerun ISC. If problem persists, repeat ICAL.	Flagging is not appropriate.	No samples shall be analyzed until ISC has met acceptance criteria. ISC can serve as the initial daily CCV.
Initial Calibration Verification (ICV)	Once after each ICAL, analysis of a second source standard prior to sample analysis.	Analyte concentrations must be within ±30% of their true value.	Correct problem, rerun ICV. If problem persists, repeat ICAL.	Flagging is not appropriate.	No samples shall be analyzed until calibration has been verified.
Continuing Calibration Verification (CCV)	Prior to sample analysis, after every 10 field samples, and at the end of the analytical sequence.	Concentration of analytes must range from the LOQ to the mid-level calibration concentration. Analyte concentrations must be within ±30% of their true value.	Immediately analyze two additional consecutive CCVs. If both pass, samples may be reported without reanalysis. If either fails, or if two consecutive CCVs cannot be run, perform corrective action(s) and repeat CCV and all associated samples since last successful CCV. Alternately, recalibrate if necessary; then reanalyze all associated samples since the last acceptable CCV.	If reanalysis cannot be performed, data must be qualified and explained in the Case Narrative. Apply Q-flag to all results for the specific analyte(s) in all samples since the last acceptable calibration verification.	Results may not be reported without valid CCVs. Instrument Sensitivity Check (ISC) can serve as a bracketing CCV.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Instrument Blanks	Immediately following the highest standard analyzed and daily prior to sample analysis.	Concentration of each analyte must be ≤ ½ the LOQ.	If acceptance criteria are not met after the highest calibration standard, calibration must be performed using a lower concentration for the highest standard until acceptance criteria is met. If acceptance criteria are not met after the highest standard which is not included in the calibration, the standard cannot be used to determine the highest concentration in samples at which carryover does not occur. If acceptance criteria are not met after sample, additional instrument blanks must be analyzed until acceptance criteria are met. Additional samples shall not be analyzed until acceptance criteria are met.	Flagging is only appropriate in cases when the sample cannot be reanalyzed and when there is no more sample left.	Note: Successful analysis following the highest standard analyzed determines the highest concentration that carryover does not occur. The highest standard analyzed may be analyzed as part of the calibration curve or following the calibration curve. If analyzed following the calibration curve, it is not used to extend out the calibration range. It is used only to document a higher concentration at which carryover still does not occur. If sample concentrations exceed this range and the sample(s) following exceed this acceptance criteria (>1/2 LOQ), they must be reanalyzed.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water

QC Check	Minimum Frequency	Acceptance Criteria	Corrective Action	Flagging Criteria	Comments
Extracted Internal Standard Analytes	Every field sample, standard, blank, and QC sample.	Added to sample prior to extraction. For aqueous samples prepared by serial dilution instead of SPE, added to samples prior to analysis. Extracted Internal Standard Analyte recoveries must be within 50% to150% of the true value.	If recoveries are acceptable for QC samples, but not field samples, the field samples must be reprepped and reanalyzed (greater dilution may be needed). If recoveries are unacceptable for QC samples, correct problem, and reanalyze all associated failed field samples.	Apply Q-flag and discuss in the Case Narrative only if reanalysis confirms failures in exactly the same manner.	Failing analytes shall be thoroughly documented in the Case Narrative.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Injection Internal Standard Analytes	Every field sample, standard, blank, and QC sample.	Added to aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within -50% to +50% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within -50% to +50% of the peak area measured in daily initial CCV.	If peak areas are unacceptable, analyze a second aliquot of the extract or sample if enough extract remains. If there is not enough extract, reanalyze the first aliquot. If second analysis meets acceptance criteria, report the second analysis. If it fails, either analysis may be reported with the appropriate flags.	Apply Q-flag and discuss in the Case Narrative.	Alternative Injection Internal Standard Analytes are recommended when there is obvious chromatographic interference.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Method Blank (MB)	One per preparatory batch.	No analytes detected > ½ LOQ or > 1/10th the amount measured in any sample or 1/10th the regulatory limit, whichever is greater.	Correct problem. If required, reprep and reanalyze MB and all QC samples and field samples processed with the contaminated blank.	If reanalysis cannot be performed, data must be qualified and explained in the Case Narrative. Apply B-flag to all results for the specific analyte(s) in all samples in the associated preparatory batch.	Results may not be reported without a valid MB. Flagging is only appropriate in cases where the samples cannot be reanalyzed.
Laboratory Control Sample (LCS)	One per preparatory batch.	Blank spiked with all analytes at a concentration ≥ LOQ and ≤ the mid-level calibration concentration. Use in-house LCS limits if project limits are not specified.	Correct problem, then re-prep and reanalyze the LCS and all samples in the associated preparatory batch for failed analytes if sufficient sample material is available.	If reanalysis cannot be performed, data must be qualified and explained in the Case Narrative. Apply Q-flag to specific analyte(s) in all samples in the associated preparatory batch.	Results may not be reported without a valid LCS. Flagging is only appropriate in cases where the samples cannot be reanalyzed.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Matrix Spike	One per preparatory batch. Not required for aqueous samples prepared by serial dilution instead of SPE.	Sample spiked with all analytes at a concentration ≥ LOQ and ≤ the mid-level calibration concentration. Use in-house LCS limits if project limits are not specified.	Examine the project-specific requirements. Contact the client as to additional measures to be taken.	For the specific analyte(s) in the parent sample, apply J-flag if acceptance criteria are not met and explain in the Case Narrative.	For matrix evaluation only. If MS results are outside the limits, the data shall be evaluated to determine the source(s) of difference (i.e., matrix effect or analytical error).

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
Matrix Spike Duplicate (MSD) or Matrix Duplicate (MD)	For MSD: One per preparatory batch. For MD: Each aqueous sample prepared by serial dilution instead of SPE.	For MSD: Sample spiked with all analytes at a concentration ≥ LOQ and ≤ the mid-level calibration concentration. For MSD: Use in-house LCS limits if project limits are not specified. RPD ≤ 30% (between MS and MSD or sample and MD).	Examine the project-specific requirements. Contact the client as to additional measures to be taken.	For the specific analyte(s) in the parent sample, apply J-flag if acceptance criteria are not met and explain in the Case Narrative.	The data shall be evaluated to determine the source of difference. For Sample/MD: RPD criteria only apply to analytes whose concentration in the sample is greater than or equal to the LOQ. The MD is a second aliquot of the field sample that has been prepared by serial dilution.
Post Spike Sample	Only applies to aqueous samples prepared by serial dilution instead of SPE that have reported value of "<LOQ" for analyte(s).	Spike aliquot(s) of sample at the final dilution(s) reported for sample with all analytes that have reported value of "<LOQ" in the final dilution. The spike must be at the LOQ concentration to be reported with the sample (the "<LOQ" value). When analyte concentrations are calculated as "<LOQ,"	When analyte concentrations are calculated as "<LOQ," and the spike recovery does not meet the 70-130% acceptance criteria, the sample, sample duplicate, and post spike sample must be reanalyzed at consecutively higher dilutions until the criteria is met.	Flagging is not appropriate.	When analyte concentrations are calculated as "<LOQ," results may not be reported without acceptable post spike recoveries.

Table B-15. Per- and Polyfluoroalkyl Substances (PFAS) Using Liquid Chromatography Tandem Mass Spectrometry (LC/MS/MS) With Isotope Dilution or Internal Standard Quantification in Matrices Other Than Drinking Water					
QC Check	**Minimum Frequency**	**Acceptance Criteria**	**Corrective Action**	**Flagging Criteria**	**Comments**
		the spike must recover within 70-130%of its true value.

[1]Promulgated in this table means there is a regulation or advisory value, but it may not meet the definition of promulgated under CERCLA

Acronyms and Abbreviations:
mg/g = milligrams per gram
mg/kg = milligrams per kilogram
ng/L = nanograms per liter
N/A = not applicable
DEC = Department of Environmental Conservation
DEP = Division of Environmental Protection
DEQ = Department of Environmental Quality
EPA = U.S. Environmental Protection Agency
IDEM = Department of Environmental Management
HAL = Health Advisory Level
MCL = Maximum Contaminant Level
MDH = Minnesota Department of Health
MTGW = Migration to Groundwater
OLQ = Office of Land Quality
PCL = Protective Concentration Level
PFAS = per- and polyfluoroalkyl substance
PFBA = perfluorobutanoic acid or perfluorobutanoate
PFBS = perfluorobutanesulfonic acid or perfluorobutanesulfonate
PFDA = perfluorodecanoic acid or perfluorodecanoate
PFDoA = perfluorododecanoic acid or perfluorododecanoate
PFDS = perfluorodecanesulfonic acid or perfluorodecanesulfonate
PFHpA = perfluoroheptanoic acid or perfluoroheptanoate
PFHxA = perfluorohexanoic acid or perfluorohexanoate
PFHxS = perfluorohexanesulfonic acid or perfluorohexanesulfonate
PFNA = perfluorononoic acid or perfluorononoate
PFOA = perfluorooctanoic acid or perfluorooctanoate
PFOS = perfluorooctanesulfonic acid or perfluorooctanesulfonate
PFOSA = perfluorooctane sulfonamide
PFPeA = perfluoropentanoic acid or perfluoropentanoate
PFTeDA = perfluorotetradecanoic acid or perfluorotetradecanoate
PFTrDA = perfluorotridecanoic acid or perfluorotridecanoate
PFUA = perfluoroundecanoic acid or perfluoroundecanoate
PSRG = Preliminary Soil Remediation Goal
RBEL = Risk-Based Exposure Limit
RCL = Residual Contaminant Level
RSL = Risk-Based Screening Level

* Values in parentheses are regulated as a summation of two or more PFASs
[1]Promulgated in this table means there is a regulation or advisory value, but it may not meet the definition of promulgated under CERCLA

Acronyms and Abbreviations:
mg/kg = milligrams per kilogram
N/A = not applicable
DEC = Department of Environmental Conservation
DEP = Division of Environmental Protection
DEQ = Department of Environmental Quality
EPA = U.S. Environmental Protection Agency
IDEM = Department of Environmental Management
HAL = Health Advisory Level
MCL = Maximum Contaminant Level
MDH = Minnesota Department of Health
MTGW = Migration to Groundwater
OLQ = Office of Land Quality
PCL = Protective Concentration Level

Country	State or Jurisdiction	Media	PFBS	PFHxS	PFOS	PFDS	PFBA	PFPeA	PFHxA	PFHpA	PFOA	PFNA	PFDA	PFUA	PFDoA	PFTrA	PFTeA	PFOSA	Type	Units	Author	Date Issued or Updated	Proposed or Promulgated[1]	Web link

PFAS = per- and polyfluoroalkyl substance
PFBA = perfluorobutanoic acid or perfluorobutanoate
PFBS = perfluorobutanesulfonic acid or perfluorobutanesulfonate
PFDA = perfluorodecanoic acid or perfluorodecanoate
PFDoA = perfluorododecanoic acid or perfluorododecanoate
PFDS = perfluorodecanesulfonic acid or perfluorodecanesulfonate
PFHpA = perfluoroheptanoic acid or perfluoroheptanoate
PFHxA = perfluorohexanoic acid or perfluorohexanoate
PFHxS = perfluorohexanesulfonic acid or perfluorohexanesulfonate
PFNA = perfluorononanoic acid or perfluorononanoate
PFOA = perfluorooctanoic acid or perfluorooctanoate
PFOS = perfluorooctanesulfonic acid or perfluorooctanesulfonate
PFOSA = perfluorooctane sulfonamide
PFPeA = perfluoropentanoic acid or perfluoropentanoate
PFTeDA = perfluorotetradecanoic acid or perfluorotetradecanoate
PFTrDA = perfluorotridecanoic acid or perfluorotridecanoate
PFUA = perfluoroundecanoic acid or perfluoroundecanoate
PSRG = Preliminary Soil Remediation Goal
RBEL = Risk-Based Exposure Limit
RCL = Residual Contaminant Level
RSL = Risk-Based Screening Level

Appendix K
Field Change Report
U.S. Army Environmental Command
Per- and Polyfluoroalkyl Substances Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Installation Name:	Radford Army Ammunition Plant	Event Date:	20 April 2022
Contract No:	3W912DR-18-D-0004	Prepared By:	K. Toth
Project/Task No:	30001992.3DN10	Applicable Document:	Quality Assurance Project Plan Addendum: Worksheet #18 and associated figure(s)
Field Change Report No:	FCR-RFAAP-07		

1. Description

One groundwater sample (RFAAP-OFS1-GW-1) at the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI was moved less than 30 feet south of the proposed location.

2. Reason for Change

The proposed location at the Old Fire Station 1, Old Ladder Shed, and Current Storage Shed AOPI did not allow for drill rig access. More specifically, the drill rig could not fit underneath overhead pipes or between buildings to access the proposed location. Therefore, the sample was collected less than 30 feet south (closer to the AOPI) of the proposed location, remaining downgradient of the AOPI.

3. Impact on Present and Completed Work

No anticipated impact on the overall scope of project work.

4. Remarks

No remarks.

EXECUTIVE SUMMARY

This Data Usability Summary Report (DUSR) for Radford Army Ammunition Plant (RFAAP) located in Radford, Virginia for the December 2020 through April 2022 sampling event describes the findings of the data review and validation and is provided to document the quality of the analytical data used for project decisions. A Data Usability Summary Table at the end of this DUSR lists the data that was qualified and the reason for qualification. Only the sample locations associated with this site and sampling event in the associated laboratory data packages and data validation reports are addressed in this report. The text below adds details where further discussion is warranted. The project-specific sampling and analysis, overall quality control (QC), and quality assurance protocols are presented in the Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan (PQAPP Arcadis 2019), and the Uniform Federal Policy-Quality Assurance Project Plan Addendum for Radford Army Ammunition Plant, Virginia (QAPP Addendum Arcadis 2020).

Samples were shipped to Pace Analytical (Pace) located in West Columbia, South Carolina for analysis. The total organic carbon (TOC) analyses were subcontracted to Pace Gulf Coast (Pace GC) located in Baton Rouge, Louisiana. Pace and Pace GC are United States Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP) and National Environmental Laboratory Accreditation Program (NELAP) accredited laboratories. The analytical sample delivery groups (SDGs) and associated Arcadis validation reports are listed in the table below. Summaries of the sample IDs and their associated laboratory IDs, SDGs, sampling dates, and analyses performed are provided in the laboratory reports and data validation reports (DVRs). Note the result pages in the DVRs may have a red line through specific or all compounds to indicate those results are not reportable. Results will be reported from either the initial, diluted, or re-extracted analysis.

In accordance with the project QAPP data review requirements, Stage 3, and 10 percent Stage 4 validation of the analytical data was performed by Arcadis project chemists that are independent of the project team. The validation was performed in accordance with the guidelines and control criteria specified in the following documents:

USDOD. Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.3 May 2019.

USDOD. DoD General Data Validation Guidelines, November 2019.

USDOD. DoD Final Data Validation Guidelines Module 3: PFAS, May 2020.

Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan (PQAPP Arcadis 2019).

The laboratory data packages and validation reports that were reviewed for this DUSR are listed below.

Sample Delivery Groups (SDG)	Validation Report	Matrix	Parameters	Validation Level
VL11008 220121669	40624R	Soil/Water	PFAS, TOC, Soil pH	Stage 3: 7 field samples, 1 field duplicate; Stage 4: 1 field sample

Sample Delivery Groups (SDG)	Validation Report	Matrix	Parameters	Validation Level
WA08110 221011470	40825R	Soil/ Sediment/ Water	PFAS, TOC, Soil pH	Stage 3: 14 field samples, 4 field duplicates; Stage 4: 2 field samples
WA08111 221011469	40833R	Soil	PFAS, TOC, Soil pH	Stage 3: 6 field samples; Stage 4: 1 field sample
WD20009	41884R	Water	PFAS	Stage 4: 1 field sample
XD22031	45517R	Water	PFAS	Stage 3: 1 field sample, 1 field duplicate; Stage 4: 1 field sample

PRECISION

Precision is expressed as a relative percent difference (RPD) between the results of replicate sample analyses: sample duplicates, laboratory control sample duplicates (LCSDs), and matrix spike duplicates (MSDs). The RPD limit for LCSDs and MSDs is 30 percent. Field duplicates were collected at a frequency of 5 percent. Unless documented below or in the Data Usability Summary table, the RPD between the parent samples and associated field duplicates were within acceptable limits of 35 percent for water matrix and 50 percent for soil matrix.

Groundwater sample RFAAP-31MW1-010521 was identified as the parent sample to field duplicate RFAAP-FD-1-GW-010521. The evaluation of the parent sample and field duplicate indicate precision was within criteria of 35 percent RPD.

Surface water sample RFAAP-TEF-SW-1-010521 was identified as the parent sample to field duplicate RFAAP-FD-1-SW-010521. The evaluation of the parent sample and field duplicate indicate precision was within criteria of 35 percent RPD.

Soil sample RFAAP-RW-SO-1-(0-2)-120820 was identified as the parent sample to field duplicate RFAAP-FD-1-SO-120820. The evaluation of the parent sample and field duplicate indicate precision was within criteria of 50 percent RPD.

Sediment sample RFAAP-TEF-SD-1-010521 was identified as the parent sample to field duplicate RFAAP-FD-1-SD-010521. The evaluation of the parent sample and field duplicate indicate precision was within criteria of 50 percent RPD.

Soil sample RFAAP-OFS1-SO-2-(0-2)-010621 was identified as the parent sample to field duplicate RFAAP-FD-2-SO-010621. The evaluation of the parent sample and field duplicate indicate precision was within criteria of 50 percent RPD.

Groundwater sample RFAAP-OFS1-GW-1-042022 was identified as the parent sample to field duplicate RFAAP-FD-2-GW-042022. The evaluation of the parent sample and field duplicate indicate precision was within criteria of 35 percent RPD.

ACCURACY

Accuracy is demonstrated by recovery of target analytes from fortified blank and sample matrices, LCS/LCSDs and MS/MSDs, respectively. The recovery of target analytes from fortified samples is compared to acceptance criteria. The criteria are listed in DoD QSM 5.3 Appendix C, Table C-44 and C-45. The criteria for EIS recoveries are 50 to 150 percent. In addition, Stage 4 validation of initial and continuing calibration results provide information on analytical accuracy. Unless documented below or in the Data Usability Summary table, the recoveries of LCS, MS/MSD, and extracted internal standards (EIS), and calibration criteria, were within acceptable limits.

As noted in the Data Usability Summary Table, EIS recoveries were outside control limits for three samples where the data was qualified. Since EIS are associated with specified compounds, only a few compounds per sample may be qualified.

REPRESENTATIVENESS

Representativeness is the degree to which sample data accurately and precisely represent site conditions and is dependent on sampling and analytical variability and the variability (or homogeneity) of the site itself. The use of the prescribed field and laboratory analytical methods with associated holding times and preservation requirements are intended to provide representative data.

All samples were collected and submitted for analysis in accordance with the procedures and sampling plan specified in the site QAPP and field SOPs. Analysis of samples was in accordance with the USACE PFAS PA/SI PQAPP, DoD QSM, and laboratory SOPs. All hold times were met except for soil pH as noted in the Data Usability Summary Table.

SENSITIVITY

Sensitivity describes the relationship between the laboratory quantitation limits and the project action limits. Reported laboratory quantitation limits are compared to the project detection limits to ensure that the analytical methods are capable of quantifying target analytes to a level that would satisfy DQOs.

The detection limits for the soil samples were elevated due to correction for percent moisture.

COMPLETENESS

The completeness for this data set met the criteria of 90 percent. No results were qualified as potentially unusable with an “X” qualifier.

Two samples were not collected as planned. Sample location RFAAP-TEF-GW-2 at the Teflon coating facility was not collected due to refusal in the area. Surface water sample RFAAP-CFS-SW-1 at the current fire station was not collected as no water was present. All other samples were collected as planned.

CONCLUSIONS

The overall assessment of the field samples, QA/QC data review by manual validation of the December 2020 through April 2022 data set from RFAAP met project requirements and completeness goals. Based upon the Stage 3 and Stage 4 data validation, all results are considered valid and usable. The results that are qualified as estimated are usable with caution. As the goal of these sampling events is to determine the presence or absence of PFAS, the detections are valid, but the reported concentration may be biased. If the data is evaluated against screening criteria, qualified results at or near the screening criteria should be evaluated considering the possible bias in the reported results.

DATA USABILITY SUMMARY TABLE

DATA USABILITY SUMMARY TABLE
Radford Army Ammunition Plant; December 2020-April 2022 Sampling Events

Sample Locations	Compound	Qualifier	Reason
RFAAP-RW-GW-1-120820 RFAAP-TEF-GW-3-120920	Perfluorotetradecanoic acid	UJ	EIS %R less than 50%.
RFAAP-OFS1-SO-4-(0-2)-010621 RFAAP-OFS1-SO-5-(0-2)-010621 RFAAP-CFS-SO-1-(0-2)-010621	Perfluorooctanesulfonic acid	J	Ion Ratio %R

RFAAP-OFS1-SW-1-041521	Perfluorohexanesulfonic acid	J	Ion ratio %R greater than 150%
RFAAP-OFS2-GW-1-042022	Perfluorodecanoic acid	J-	MS %R high bias; MSD %R low bias; MS/MSD RPD
	All other target PFAS compounds	UJ non-detects J- detects	MSD %R low bias; MS/MSD RPD
RFAAP-EB-6-042022	6:2 FTS	J-	EIS %R greater than 150%
RFAAP-RW-SO-(1-2)-120820 RFAAP-TEF-SO-1-(0-2)-120820 RFAAP-OFS2-SO-1-(0-2)-010521 RFAAP-OFS1-SO-2-(0-2)-010621 RFAAP-CFS-SO-1-(0-2)-010621	Soil pH	J	Hold time exceedance

J (Estimated): The compound or analyte was analyzed for and positively identified by the laboratory; however, the reported concentration is estimated due to non-conformances discovered during data validation.

J+ (Estimated): The compound or analyte was analyzed for and positively identified by the laboratory; however, the reported concentration is estimated due to non-conformances discovered during data validation. Result may be biased high.

J- (Estimated): The compound or analyte was analyzed for and positively identified by the laboratory; however, the reported concentration is estimated due to non-conformances discovered during data validation. Result may be biased low.

UJ (Non-detected estimated): The compound or analyte was reported as not detected by the laboratory; however, the reported quantitation/detection limit is estimated due to non-conformances discovered during data validation.

X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

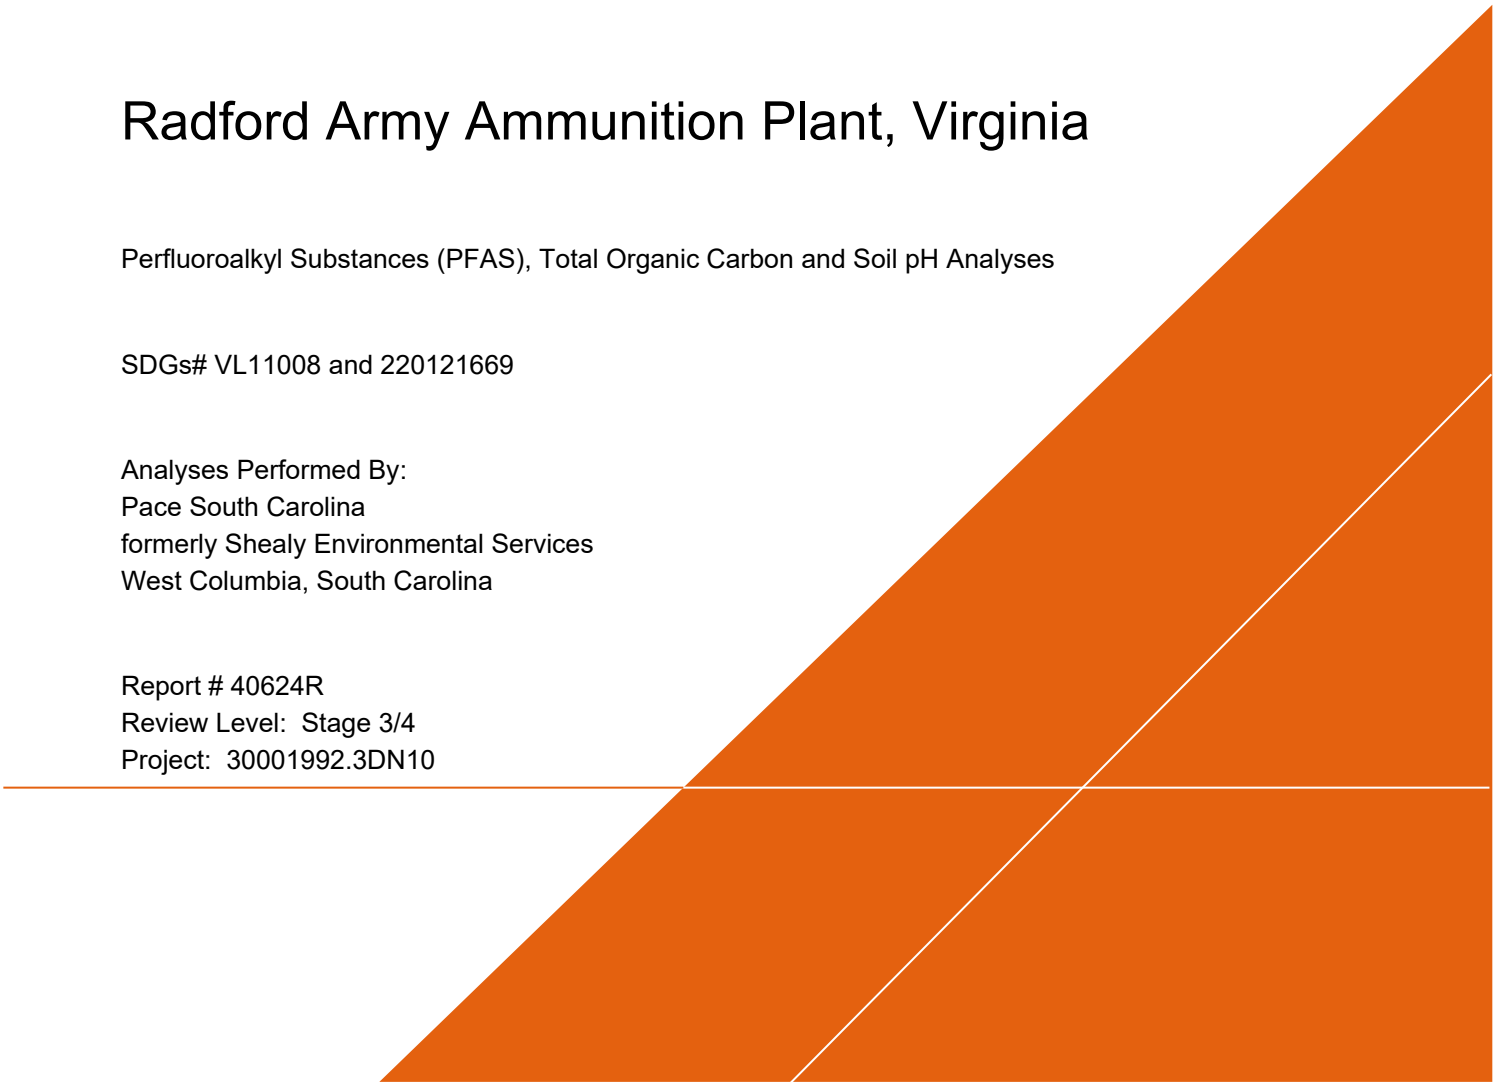
DATA REVIEW



Radford Army Ammunition Plant, Virginia

Perfluoroalkyl Substances (PFAS), Total Organic Carbon and Soil pH Analyses

SDGs# VL11008 and 220121669

Analyses Performed By:
Pace South Carolina
formerly Shealy Environmental Services
West Columbia, South Carolina

Report # 40624R
Review Level: Stage 3/4
Project: 30001992.3DN10

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # VL11008 and 220121669 for samples collected in association with the Radford Army Ammunition Site. The review was conducted as a Stage 3/4 evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDGs	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						PFAS	TOC	pH
VL11008	RFAAP-RW-SO-1-(0-2)-120820	VL11008-001	Soil	12/8/2020		X		X
	RFAAP-FD-1-SO-120820	VL11008-002	Soil	12/8/2020	RFAAP-RW-SO-1-(0-2)-120820	X		
	RFAAP-TEF-SO-1-(0-2)-120820	VL11008-003	Soil	12/8/2020		X		X
	RFAAP-RW-GW-1-120820	VL11008-004	Water	12/8/2020		X		
	RFAAP-FB-1-120820	VL11008-005	Water	12/8/2020		X		
	RFAAP-TEF-GW-1-120820	VL11008-006	Water	12/8/2020		X		
	RFAAP-TEF-SO-3-(0-2)-120820	VL11008-007	Soil	12/8/2020		X		
	RFAAP-TEF-SO-2-(0-2)-120820	VL11008-008	Soil	12/8/2020		X		
	RFAAP-EB-1-120820	VL11008-009	Water	12/8/2020		X		
	RFAAP-EB-2-120820	VL11008-010	Water	12/8/2020		X		
	RFAAP-EB-3-120820	VL11008-011	Water	12/8/2020		X		
	RFAAP-TEF-GW-3-120820	VL11008-012	Water	12/8/2020		X		
220121669	RFAAP-RW-SO-1-(0-2)-120820	22012166901	Soil	12/8/2020			X	
	RFAAP-TEF-SO-1-(0-2)-120820	22012166902	Soil	12/8/2020			X	

Notes:

1. Stage 4 validation was performed on sample RFAAP-TEF-GW-1-120820.
2. Matrix spike / Matrix spike duplicate (MS/MSD) analysis was performed on sample RFAAP-RW-SO-1-(0-2)-120820.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA - Quality Assurance

The laboratory received an additional aqueous sample that was not listed on the chain of custody. There was no collection date on the sample label for RFAAP-TEF-GW-3-120920 but the time was stated as 1355 on the sample label. This sample was logged in for PFAS analysis.

The sample id mismatch observed between chain of custody and results section for below samples. As per project team communication, the reported sample id is correct and reported in this report.

Sample ID on Chain of Custody	Reported Sample ID
RFAAP-RW-SO-(1-2)-120820	RFAAP-RW-SO-1-(0-2)-120820
RFAAP-TEF-GW-3-120920	RFAAP-TEF-GW-3-120820

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Modified Method 537. Data were reviewed in accordance with USEPA Method 537, Pace (Shealy) Laboratories SOP ME00213-12 Determination of Per- and Polyfluoroalkyl Substances (PFAS) by LC/MS/MS (Isotope Dilution) QSM 5.3 Table B-15, Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, DoD Final Data Validation Guidelines Module 3: PFAS, May 2020, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified, and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers

  U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The reported result was an estimated value with an unknown bias.

  J+ The result was an estimated quantity, but the result may be biased high.

  J- The result was an estimated quantity, but the result may be biased low.

  UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

PERFLUOROALKYL SUBSTANCES (PFAS) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
USEPA modified 537 DoD QSM 5.3	Soil	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C
	Water	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method, instrument, and equipment rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination. Equipment rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the DL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Mass Calibration

Mass calibration and system performance were acceptable.

4. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $r^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit of 30%.

All compounds associated with the initial and continuing calibrations were within the specified control limits.

4.3 Instrument Sensitivity Check (ISC)

The ISC concentration must be at the LOQ. All target compounds associated with the ISC must exhibit a percent recovery (%R) of 70 to 130%.

All compounds associated with ISC recoveries were within control limits.

4.4 Ion Transitions

Quantitation of analytes must use the ion transitions documented in DoD QSM 5.3 Table B-15.

The ion transitions were as specified in DoD QSM 5.3.

5. Isotopically labeled Standards

5.1 Extracted Internal Standards (EIS)

Labeled standards must be added to all field samples and QC samples prior to extraction. Labeled standards must be added to all field samples and QC samples prior to extraction. EIS recoveries must be within 50% to150% of ICAL midpoint standard area or area measured in the initial CCV on days when ICAL not performed.

Samples associated with EIS exhibiting recoveries outside of the control limits are presented in the following table.

Sample ID	EIS	Associated Compound	EIS %R
RFAAP-RW-GW-1-120820	13C2_PFTeDA	Perfluoro-n-tetradecanoic acid (PFTeDA)	< 50% but > 20%
RFAAP-TEF-GW-3-120820	13C2_PFTeDA	Perfluoro-n-tetradecanoic acid (PFTeDA)	< 50% but > 20%

The criteria used to evaluate the EIS recoveries are presented in the following table. In the case of an EIS deviation, the sample results associated with the EIS are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> 150%	Non-detect	No Action
	Detect	J-
< 50% but > 20%	Non-detect	UJ
	Detect	J+
< 20%	Non-detect	UX
	Detect	X

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the DoD QSM 5.3

acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must be ≤ 30%.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample ID	Compounds	MS Recovery	MSD Recovery
RFAAP-RW-SO-1-(0-2)-120820	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	AC	>UL
	Perfluorobutane sulfonic acid (PFBS)	>UL	AC
	Perfluorodecanoic acid (PFDA)	AC	>UL
	Perfluorododecanoic acid (PFDoA)	AC	>UL
	Perfluoroheptanoic acid (PFHpA)	>UL	>UL
	Perfluorohexane sulfonic acid (PFHxS)	>UL	>UL
	Perfluorohexanoic acid (PFHxA)	>UL	>UL
	Perfluorononanoic acid (PFNA)	>UL	>UL
	Perfluorooctane sulfonic acid (PFOS)	>UL	>UL
	Perfluorooctanoic acid (PFOA)	>UL	AC
	Perfluoropentanoic acid (PFPeA)	>UL	>UL
	Perfluorotetradecanoic acid (PFTeDA)	AC	>UL
	Perfluorotridecanoic acid (PFTrDA)	AC	>UL

Notes:
AC Acceptable
UL Upper control limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J+
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J-
< 10%	Non-detect	UX
	Detect	J-

Sample associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample ID	Compounds
RFAAP-RW-SO-1-(0-2)-120820	1H, 1H, 2H, 2H-perfluorodecane sulfonic acid (8:2 FTS)
	6:2 Fluorotelomer sulfonic acid (6:2 FTS)

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> 30%	Non-detect	UJ
	Detect	J

The compounds 1H, 1H, 2H, 2H-perfluorodecane sulfonic acid (8:2 FTS) and 6:2 Fluorotelomer sulfonic acid (6:2 FTS) in sample RFAAP-RW-SO-1-(0-2)-120820 and associated field duplicate RFAAP-FD-1-SO-120820 were qualified as estimated (UJ).

7. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soils is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of two times the LOQ is applied for water matrices and three time the LOQ for soil matrices.

Results for field duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
RFAAP-RW-SO-1-(0-2)-120820 / RFAAP-FD-1-SO-120820	All target compounds	U	U	AC

Note:

AC Acceptable

The results between the parent sample and the field duplicate were acceptable.

9. Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met method criteria.

10. System Performance and Overall Assessment

The case narrative notes that samples RFAAP-RW-GW-1-120820, RFAAP-TEF-GW-1-120820 and RFAAP-TEF-GW-3-120820 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; sample was spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <10mL and reconstituted to 10mL using MeOH by transfer pipet. Hence, the target compounds were not qualified for these samples.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 9045D and 9060A. Data were reviewed in accordance with Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers
  - U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.
  - J The reported value was obtained from a reading less than the limit of detection (LOQ), but greater than or equal to the detection limit (DL).
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
- Validation Qualifiers
  - J The reported result was an estimated value with an unknown bias.
  - J+ The result was an estimated quantity, but the result may be biased high.
  - J- The result was an estimated quantity, but the result may be biased low.
  - UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
  - UB Analyte considered non-detect at the listed value due to associated blank contamination.
  - X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Total Organic Carbon (TOC) by SW846 9060A	Soil	28 days from collection to analysis	Cool to <6 °C.
pH by SW846 9045D	Soil	Within 24 hours of receipt at laboratory	Cool to <6 °C.

The analyses that exceeded the holding time are presented in the following table.

Sample ID	Holding Time	Criteria
RFAAP-RW-SO-1-(0-2)-120820 RFAAP-TEF-SO-1-(0-2)-120820	8 days from collection; 6 days from receipt	Within 24 hours of receipt at laboratory

Sample results associated with sample locations analyzed by analytical method SW-846 9045D were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification
	Detected Analytes
Analysis completed past the holding time	J

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

TOC was not detected above the DL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

pH: The initial and continuing calibration criteria were within the acceptance criteria of ± 0.05 SU of the true value.

4. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater.

A MS analysis was not performed for TOC.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the LOQ. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of one time the LOQ is applied for water matrices and two times the LOQ for soil matrices.

The difference between the sample result and the laboratory duplicate result must be within QAPP specified control limit of less than or equal to 0.1 su. for pH.

A laboratory duplicate analysis was performed on sample RFAAP-RW-SO-1-(0-2)-120820 for TOC and pH. The results were within the control limits.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of three times the LOQ is applied for soil matrices.

A field duplicate was not collected for TOC and pH analysis.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Samples Receipt Checklist (SRC) (ME0018C-15)
Issuing Authority: Pace ENV - WCOL

Revised:9/29/2020
Page 1 of 1

Sample Receipt Checklist (SRC)

Client: ARCADIS — Cooler Inspected by/date: BMG / 12/11/20 — Lot #: VL11008

Means of receipt: ☐ Pace ☐ Client ☐ UPS ☒ FedEx ☐ Other: _____

☒ Yes	☐ No		1. Were custody seals present on the cooler?
☒ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: MA — Chlorine Strip ID: MA — Tested by: MA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt — %Solid Snap-Cup ID: 20-20516

1.9 / 1.9 °C MA / MA °C MA / MA °C MA / MA °C

Method: ☒ Temperature Blank ☐ Against Bottles IR Gun ID: 5 IR Gun Correction Factor: 0 °C

Method of coolant: ☒ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☒ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☒ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☒ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☒ Yes	☐ No		6. Were sample IDs listed on the COC?
☒ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☒ Yes	☐ No		8. Was collection date & time listed on the COC?
☒ Yes	☒ No		9. Was collection date & time listed on all sample containers?
☒ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☒ Yes	☐ No		11. Were tests to be performed listed on the COC?
☒ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☒ Yes	☐ No		13. Was adequate sample volume available?
☒ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☒ Yes	☐ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☐ Yes	☐ No	☒ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☒ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☒ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☒ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☒ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☒ Yes	☐ No		21. Was the quote number listed on the container label? If yes, Quote # 24252

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) MA were received incorrectly preserved and were adjusted accordingly in sample receiving with MA mL of circle one: H_2SO_4, HNO_3, HCl, NaOH using SR # _____.
Time of preservation MA. If more than one preservative is needed, please note in the comments below.

Sample(s) MA were received with bubbles >6 mm in diameter.

Samples(s) MA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: MA.

SR barcode labels applied by: BMG Date: 12/11/2020

Comments: Excess aqueous sample: REAAP-TEF-GW-3-12820 taken on 1355 no sample date.

Inorganic non-metals

Radford Army Ammunition Plant PFAS PA/SI

DATA REVIEW

Radford Army Ammunition Plant, Virginia

Perfluoroalkyl Substances (PFAS), Total Organic Carbon and Soil pH Analyses

SDGs# WA08110 and 221011470

Analyses Performed By:
Pace South Carolina
formerly Shealy Environmental Services
West Columbia, South Carolina

Report # 40825R
Review Level: Stage 3/4
Project: 30001992.3DN10

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # WA08110 and 221011470 for samples collected in association with the Radford Army Ammunition Plant Site. The review was conducted as a Stage 3/4 evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDGs	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis

10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Modified Method 537. Data were reviewed in accordance with USEPA Method 537, Pace (Shealy) Laboratories SOP ME00213-12 Determination of Per- and Polyfluoroalkyl Substances (PFAS) by LC/MS/MS (Isotope Dilution) QSM 5.3 Table B-15, Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, DoD Final Data Validation Guidelines Module 3: PFAS, May 2020, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified, and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers

  U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The reported result was an estimated value with an unknown bias.

  J+ The result was an estimated quantity, but the result may be biased high.

  J- The result was an estimated quantity, but the result may be biased low.

  UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

PERFLUOROALKYL SUBSTANCES (PFAS) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
USEPA modified 537 DoD QSM 5.3	Soil	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C
	Water	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method, instrument, and equipment rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination. Equipment rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the DL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

The compound 1H, 1H, 2H, 2H-perfluorooctane sulfonic acid (6:2 FTS) results were qualified by the laboratory with “UB” for samples RFAAP-OFS2-SO-2-(0-2)-010521, RFAAP-RW-SO-3-(0-2)-010521, and RFAAP-RW-SO-4-(0-2)-010521. However, the compound result is non-detect in method blank preparation batch 79252. Hence, “UB” qualifier was removed, and qualification is not required. 6:2 FTS had been detected in the method blank for preparation batch 79250. The associated samples and lab QC were re-extracted, and 6:2 FTS was reported from preparation batch 79745.

3. Mass Calibration

Mass calibration and system performance were acceptable.

4. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $r^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit of 30%.

All compounds associated with the initial and continuing calibrations were within the specified control limits.

4.3 Instrument Sensitivity Check (ISC)

The ISC concentration must be at the LOQ. All target compounds associated with the ISC must exhibit a percent recovery (%R) of 70 to 130%.

All compounds associated with ISC recoveries were within control limits.

4.4 Ion Transitions

Quantitation of analytes must use the ion transitions documented in DoD QSM 5.3 Table B-15.

The ion transitions were as specified in DoD QSM 5.3.

5. Isotopically labeled Standards

5.1 Extracted Internal Standards (EIS)

Labeled standards must be added to all field samples and QC samples prior to extraction. Labeled standards must be added to all field samples and QC samples prior to extraction. EIS recoveries must be within 50% to150% of ICAL midpoint standard area or area measured in the initial CCV on days when ICAL not performed.

Samples associated with EIS exhibiting recoveries outside of the control limits are presented in the following table.

Sample ID	EIS	Associated Compound	EIS %R
RFAAP-FD-1-GW-010521	13C2_8:2FTS	1H, 1H, 2H, 2H-perfluorodecane sulfonic acid (8:2 FTS)	> 150%

The criteria used to evaluate the EIS recoveries are presented in the following table. In the case of an EIS deviation, the sample results associated with the EIS are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> 150%	Non-detect	No Action
	Detect	J-
< 50% but > 20%	Non-detect	UJ
	Detect	J+
< 20%	Non-detect	UX
	Detect	X

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must be ≤ 30%.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

MS/MSD analysis performed on samples RFAAP-TEF-SD-1-010521, and RFAAP-OFS1-SO-2-(0-2)-010621 exhibited recoveries and RPDs within the control limits.

MS/MSD analysis performed on sample RFAAP-TEF-SW-1-010521 exhibited recoveries within the control limits.

Sample associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample ID	Compound
RFAAP-TEF-SW-1-010521	1H, 1H, 2H, 2H-perfluorodecane sulfonic acid (8:2 FTS)

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> 30%	Non-detect	UJ
	Detect	J

The compound 1H, 1H, 2H, 2H-perfluorodecane sulfonic acid (8:2 FTS) in sample RFAAP-TEF-SW-1-010521 and associated field duplicate RFAAP-FD-1-SW-010521 were qualified as estimated (UJ).

7. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

The LCS recovery for the compound 1H, 1H, 2H, 2H-perfluorooctane sulfonic acid (6:2 FTS) exhibited a high recovery for the preparation batch 79250. The batch associated samples and laboratory QC were re-prepped and re-analyzed for 6:2 FTS in the preparation batch 79745. The LCS recovery was within the control limit, and 6:2 FTS was reported from preparation batch 79745. Hence, qualification was not required.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soils is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate

sample concentrations are less than or equal to 5 times the LOQ, a control limit of two times the LOQ is applied for water matrices and three time the LOQ for soil matrices.

Results for field duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result (ng/L)	Duplicate Result (ng/L)	RPD
RFAAP-31MW1-010521 / RFAAP-FD-1-GW-010521	Perfluoro-n-butanoic acid (PFBA)	3.2 J	6.6	AC
RFAAP-TEF-SW-1-010521 / RFAAP-FD-1-SW-010521	All target compounds	U	U	AC

Sample ID/Duplicate ID	Compound	Sample Result (mg/kg)	Duplicate Result (mg/kg)	RPD
RFAAP-TEF-SD-1-010521 / RFAAP-FD-1-SD-010521	All target compounds	U	U	AC
RFAAP-OFS1-SO-2-(0-2)-010621 / RFAAP-FD-2-SO-010621	All target compounds	U	U	AC

Note:
AC Acceptable

The results between the parent samples and their associated field duplicates were acceptable.

9. Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met method criteria.

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 9045D and 9060A. Data were reviewed in accordance with Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers
  - U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.
  - J The reported value was obtained from a reading less than the limit of detection (LOQ), but greater than or equal to the detection limit (DL).
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
- Validation Qualifiers
  - J The reported result was an estimated value with an unknown bias.
  - J+ The result was an estimated quantity, but the result may be biased high.
  - J- The result was an estimated quantity, but the result may be biased low.
  - UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
  - UB Analyte considered non-detect at the listed value due to associated blank contamination.
  - X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Total Organic Carbon (TOC) by SW846 9060A	Soil	28 days from collection to analysis	Cool to <6 °C.
pH by SW846 9045D	Soil	Within 24 hours of receipt at laboratory	Cool to <6 °C.

The analyses that exceeded the holding time are presented in the following table.

Sample ID	Holding Time	Criteria
RFAAP-OFS2-SO-1-(0-2)-010521	7 days from collection; 4 days from receipt	Within 24 hours of receipt at laboratory
RFAAP-OFS1-SO-2-(0-2)-010621	6 days from collection; 4 days from receipt	

Sample results associated with sample locations analyzed by analytical method SW-846 9045D were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification
	Detected Analytes
Analysis completed past the holding time	J

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

TOC was not detected above the DL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

pH: The initial and continuing calibration criteria were within the acceptance criteria of ± 0.05 SU of the true value.

4. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater.

A MS analysis was not performed for TOC.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the LOQ. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of one time the LOQ is applied for water matrices and two times the LOQ for soil matrices.

The difference between the sample result and the laboratory duplicate result must be within QAPP specified control limit of less than or equal to 0.1 su. for pH.

A laboratory duplicate analysis was performed on sample RFAAP-OFS1-SO-2-(0-2)-010621 for pH. The result was within the control limit.

A laboratory duplicate analysis was performed on sample RFAAP-31MW1-010521 for TOC. The RPD was within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of three times the LOQ is applied for soil matrices.

A field duplicate was not collected for TOC and pH analysis.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Turn Around Time Required (Prior lab approval required for expedited TAT): X Standard ☐ Rush (Specify)

Sample Disposal: ☐ Return to Client X Disposal by Lab

Possible Hazard Identification: X Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison ☐ Unknown

QC Requirements (Specify)

	Date	Time		Date	Time
1. Relinquished by: Abigail Harmon	01/07/21		1. Received by		
2. Relinquished by	Date	Time	2. Received by	Date	Time
3. Relinquished by	Date	Time	3. Received by	Date	Time
4. Relinquished by: FedEx	Date 1/8/21	Time 1045	4. Laboratory received by: Kristen Stayton	Date 1/8/21	Time 1045

Note: All samples are retained for four weeks from receipt unless other arrangements are made.

LAB USE ONLY — Received on ice (Circle): (Yes) No Ice Pack — Receipt Temp: 0.3 1.1 °C — Temp Blank ☐ Y ☐ N

3.0

DISTRIBUTION: WHITE & YELLOW-Return to laboratory with Sample(s); PINK-Field/Client Copy

Document Number: ME003N2-01

LOQ = Limit of Quantitation
U = Not detected at or above the LOQ
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

LOQ = Limit of Quantitation
U = Not detected at or above the LOQ
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

Radford Army Ammunition Plant PFAS PA/SI

DATA REVIEW

Radford Army Ammunition Plant, Virginia

Perfluoroalkyl Substances (PFAS), Total Organic Carbon and Soil pH Analyses

SDGs# WA08111 and 221011469

Analyses Performed By:
Pace South Carolina
formerly Shealy Environmental Services
West Columbia, South Carolina

Report # 40833R
Review Level: Stage 3/4
Project: 30001992.3DN10

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # WA08111 and 221011469 for samples collected in association with the Radford Army Ammunition Site. The review was conducted as a Stage 3/4 evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDGs	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
						PFAS	TOC	pH
WA08111	RFAAP-OFS1-SO-4-(0-2)-010621	WA08111-001	Soil	1/6/2021		X		
	RFAAP-OFS1-SO-5-(0-2)-010621	WA08111-002	Soil	1/6/2021		X		
	RFAAP-CFS-SO-1-(0-2)-010621	WA08111-003	Soil	1/6/2021		X		X
	RFAAP-CFS-SO-2-(0-2)-010621	WA08111-004	Soil	1/6/2021		X

7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Modified Method 537. Data were reviewed in accordance with USEPA Method 537, Pace (Shealy) Laboratories SOP ME00213-12 Determination of Per- and Polyfluoroalkyl Substances (PFAS) by LC/MS/MS (Isotope Dilution) QSM 5.3 Table B-15, Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, DoD Final Data Validation Guidelines Module 3: PFAS, May 2020, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified, and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers

  U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The reported result was an estimated value with an unknown bias.

  J+ The result was an estimated quantity, but the result may be biased high.

  J- The result was an estimated quantity, but the result may be biased low.

  UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

PERFLUOROALKYL SUBSTANCES (PFAS) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
USEPA modified 537 DoD QSM 5.3	Soil	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C
	Water	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method, instrument, and equipment rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination. Equipment rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the DL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Mass Calibration

Mass calibration and system performance were acceptable.

4. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $r^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit of 30%.

All compounds associated with the initial and continuing calibrations were within the specified control limits.

4.3 Instrument Sensitivity Check (ISC)

The ISC concentration must be at the LOQ. All target compounds associated with the ISC must exhibit a percent recovery (%R) of 70 to 130%.

All compounds associated with ISC recoveries were within control limits.

4.4 Ion Transitions

Quantitation of analytes must use the ion transitions documented in DoD QSM 5.3 Table B-15.

The ion transitions were as specified in DoD QSM 5.3.

5. Isotopically labeled Standards

5.1 Extracted Internal Standards (EIS)

Labeled standards must be added to all field samples and QC samples prior to extraction. Labeled standards must be added to all field samples and QC samples prior to extraction. EIS recoveries must be within 50% to150% of ICAL midpoint standard area or area measured in the initial CCV on days when ICAL not performed.

All EIS recoveries were within control limits.

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must be ≤ 30%.

A MS/MSD analysis was not performed on a sample location associated with this SDG.

7. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soils is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of two times the LOQ is applied for water matrices and three time the LOQ for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

9. Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

Sample locations associated with ion ratios outside of the control limits of 50 to 150% recovery are presented in the following table.

Sample Locations	Compound	Ion Ratio %R
RFAAP-OFS1-SO-4-(0-2)-010621	Perfluorooctanesulfonic acid	43%
RFAAP-OFS1-SO-5-(0-2)-010621	Perfluorooctanesulfonic acid	44%
RFAAP-CFS-SO-1-(0-2)-010621	Perfluorooctanesulfonic acid	40%

In the case of an ion ratio deviation, the sample results are qualified as documented in the table below.

Control limit	Sample Result	Qualification
< 50% or > 150% Recovery	Detect	J

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 9045D and 9060A. Data were reviewed in accordance with Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers

    U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.

    J The reported value was obtained from a reading less than the limit of detection (LOQ), but greater than or equal to the detection limit (DL).

- Quantitation (Q) Qualifiers

    E The compound was quantitated above the calibration range.

- Validation Qualifiers

    J The reported result was an estimated value with an unknown bias.

    J+ The result was an estimated quantity, but the result may be biased high.

    J- The result was an estimated quantity, but the result may be biased low.

    UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

    UB Analyte considered non-detect at the listed value due to associated blank contamination.

    X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Total Organic Carbon (TOC) by SW846 9060A	Soil	28 days from collection to analysis	Cool to <6 °C.
pH by SW846 9045D	Soil	Within 24 hours of receipt at laboratory	Cool to <6 °C.

The analyses that exceeded the holding time are presented in the following table.

Sample ID	Holding Time	Criteria
RFAAP-CFS-SO-1-(0-2)-010621	4 days from receipt	Within 24 hours of receipt at laboratory

Sample results associated with sample locations analyzed by analytical method SW-846 9045D were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification
	Detected Analytes
Analysis completed past the holding time	J

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

TOC was not detected above the DL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

pH: The initial and continuing calibration criteria were within the acceptance criteria of ± 0.05 SU of the true value.

4. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater.

A MS analysis was not performed for TOC.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the LOQ. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of one time the LOQ is applied for water matrices and two times the LOQ for soil matrices.

The difference between the sample result and the laboratory duplicate result must be within QAPP specified control limit of less than or equal to 0.1 su. for pH.

A laboratory duplicate was not performed on a sample location associated with this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of three times the LOQ is applied for soil matrices.

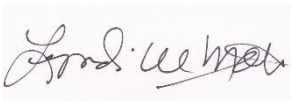
A field duplicate was not collected for TOC and pH analysis.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment



Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

LOQ = Limit of Quantitation
U = Not detected at or above the LOQ
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

DATA REVIEW

Radford Army Ammunition Plant, Virginia

Perfluoroalkyl Substances (PFAS) Analysis

SDG# WD20009

Analyses Performed By:
Pace South Carolina
formerly Shealy Environmental Services
West Columbia, South Carolina

Report # 41884R
Review Level: Stage 4
Project: 30001992.3DN10

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # WD20009 for samples collected in association with the Radford Army Ammunition Site. The review was conducted as a Stage 3/4 evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					PFAS	TOC	pH
RFAAP-OFS1-SW-1-041521	WD20009-001	Water	4/15/2021		X		

Notes:

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Modified Method 537. Data were reviewed in accordance with USEPA Method 537, Pace (Shealy) Laboratories SOP ME00213-12 Determination of Per- and Polyfluoroalkyl Substances (PFAS) by LC/MS/MS (Isotope Dilution) QSM 5.3 Table B-15, Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, DoD Final Data Validation Guidelines Module 3: PFAS, May 2020, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified, and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers

  U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The reported result was an estimated value with an unknown bias.

  J+ The result was an estimated quantity, but the result may be biased high.

  J- The result was an estimated quantity, but the result may be biased low.

  UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

PERFLUOROALKYL SUBSTANCES (PFAS) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
USEPA modified 537 DoD QSM 5.3	Soil	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C
	Water	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method, instrument, and equipment rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination. Equipment rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the DL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Mass Calibration

Mass calibration and system performance were acceptable.

4. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $r^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit of 30%.

All compounds associated with the initial and continuing calibrations were within the specified control limits.

4.3 Instrument Sensitivity Check (ISC)

The ISC concentration must be at the LOQ. All target compounds associated with the ISC must exhibit a percent recovery (%R) of 70 to 130%.

All compounds associated with ISC recoveries were within control limits.

4.4 Ion Transitions

Quantitation of analytes must use the ion transitions documented in DoD QSM 5.3 Table B-15.

The ion transitions were as specified in DoD QSM 5.3.

5. Isotopically labeled Standards

5.1 Extracted Internal Standards (EIS)

Labeled standards must be added to all field samples and QC samples prior to extraction. Labeled standards must be added to all field samples and QC samples prior to extraction. EIS recoveries must be within 50% to150% of ICAL midpoint standard area or area measured in the initial CCV on days when ICAL not performed.

All EIS recoveries were within control limits.

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must be ≤ 30%.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

7. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soils is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of two times the LOQ is applied for water matrices and three time the LOQ for soil matrices.

A field duplicate was not collected for a sample location associated with this SDG.

9. Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

Sample locations associated with ion ratios outside of the control limits of 50 to 150% recovery are presented in the following table.

Sample Locations	Compound	Ion Ratio %R
RFAAP-OFS1-SW-1-041521	Perfluorohexanesulfonic acid	195%

In the case of an ion ratio deviation, the sample results are qualified as documented in the table below.

Control limit	Sample Result	Qualification
< 50% or > 150% Recovery	Detect	J

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Radford Army Ammunition Plant PFAS PA/SI

DATA REVIEW

Radford Army Ammunition Plant, Virginia

Perfluoroalkyl Substances (PFAS) Analysis

SDG #XD22031

Analyses Performed By:
Pace South Carolina
formerly Shealy Environmental Services
West Columbia, South Carolina

Report #45517R
Review Level: Stage 3/4
Project: 30001971.3DN51

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # XD22031 for samples collected in association with the Radford Army Ammunition Plant Site. The review was conducted as a Stage 3/4 evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis		
					PFAS	TOC	pH
RFAAP-OFS2-GW-1-042022	XD22031-001	Water	4/20/2022		X		
RFAAP-OFS1-GW-1-042022	XD22031-002	Water	4/20/2022		X		
RFAAP-EB-5-042022	XD22031-003	Water	4/20/2022		X		
RFAAP-EB-6-042022	XD22031-004	Water	4/20/2022		X		
RFAAP-EB-7-042022	XD22031-005	Water	4/20/2022		X		
RFAAP-EB-9-042022	XD22031-006	Water	4/20/2022		X		
RFAAP-SB-2-042022	XD22031-007	Water	4/20/2022		X		
RFAAP-FD-2-GW-042022	XD22031-009	Water	4/20/2022	RFAAP-OFS1-GW-1-042022	X		

Note:

1. Stage 4 validation was performed on sample location RFAAP-OFS1-GW-1-042022.
2. Matrix spike/matrix spike duplicate (MS/MSD) analysis was performed on sample location RFAAP-OFS2-GW-1-042022.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Modified Method 537. Data were reviewed in accordance with USEPA Method 537, Pace (Shealy) Laboratories SOP ME00213-12 Determination of Per- and Polyfluoroalkyl Substances (PFAS) by LC/MS/MS (Isotope Dilution) QSM 5.3 Table B-15, Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, DoD General Data Validation Guidelines, November 2019, DoD Final Data Validation Guidelines Module 3: PFAS, May 2020, and Final Programmatic Uniform Federal Policy-Quality Assurance Project Plan USAEC PFAS PA/SI Active Army Installations, October 2019 (Arcadis).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified, and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Per DoD General Data Validation Guidelines November 2019 Revision 1 Section 4.8 states; "The following provides a brief explanation of the DoD data validation qualifiers assigned to results during the data review process by a data validator. The reviewer should use these qualifiers, as applicable, unless other data qualifiers are specified in a project related document, such as a QAPP. If other qualifiers are used, a complete explanation of those qualifiers should accompany the data validation report." Below are the qualifier codes that may be applied in this validation report:

- Concentration (C) Qualifiers
  - U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The reported result was an estimated value with an unknown bias.
  - J+ The result was an estimated quantity, but the result may be biased high.
  - J- The result was an estimated quantity, but the result may be biased low.
  - UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.
  - X The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

A fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

PERFLUOROALKYL SUBSTANCES (PFAS) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
USEPA modified 537 DoD QSM 5.3 Table B-15	Soil	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C
	Water	28 days to extraction; 28 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method, instrument, and equipment rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination. Equipment rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the detection limit (DL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

1H, 1H, 2H, 2H-perfluorooctane sulfonic acid (6:2 FTS) was detected in the associated QA blanks; however, the associated sample results were non-detect. No other qualification of the sample results was required.

3. Mass Calibration

Mass calibration and system performance were acceptable.

4. Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $r^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration, and initial calibration verification (ICV) standard recoveries were acceptable.

4.2 Continuing Calibration

All target compounds associated with the continuing calibration verification (CCV) standards must exhibit a percent difference (%D) less than the control limit of 30%.

All compounds associated with the continuing calibrations were within the specified control limits.

4.3 Instrument Sensitivity Check (ISC)

The ISC concentration must be at the LOQ. All target compounds associated with the ISC must exhibit a percent recovery (%R) of 70 to 130%.

All compounds associated with ISC recoveries were within control limits.

4.4 Ion Transitions

Quantitation of analytes must use the ion transitions documented in DoD QSM 5.3 Table B-15.

The ion transitions were as specified in DoD QSM 5.3.

5. Extracted Internal Standards (EIS)

Labeled standards must be added to all field samples and QC samples prior to extraction. EIS recoveries must be within 50% to 150% of ICAL midpoint standard area or area measured in the initial CCV on days when ICAL not performed.

Sample locations associated with EIS exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	EIS	Associated Compound	%R	RE %R
RFAAP-OFS2-GW-1-042022	13C2 6:2 FTS	6:2 FTS	**> 150%**	MS/MSD > 150%
RFAAP-OFS1-GW-1-042022 RFAAP-FD-2-GW-042022	13C2 6:2 FTS	6:2 FTS	**> 150%**	MS > 150%
RFAAP-EB-6-042022 RFAAP-EB-7-042022 RFAAP-EB-9-042022 RFAAP-SB-2-042022	13C2 6:2 FTS	6:2 FTS	**> 150%**	NA

Note:
NA Not analyzed

Where a re-extracted analysis was performed, results are reported from the analysis in bold above.

The criteria used to evaluate the EIS recoveries are presented in the following table. In the case of an EIS deviation, the sample results associated with the EIS are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> 150%	Non-detect	No Action
	Detect	J-
< 50% but > 20%	Non-detect	UJ
	Detect	J+

Control Limit	Sample Result	Qualification
< 20%	Non-detect	UX
	Detect	X

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must be ≤ 30%.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table. A MS analysis was performed on sample location RFAAP-OFS1-GW-1-042022.

Sample Locations	Compound	MS Recovery	MSD Recovery
RFAAP-OFS2-GW-1-042022	Perfluorodecanoic acid	>UL	<LL but >10%
	All other target PFAS compounds	AC	<LL but >10%
RFAAP-OFS1-GW-1-042022	Perfluorohexanesulfonic acid	SR>4X	--

Note:
AC Acceptable
UL Upper control limit
LL Lower control limit
SR>4X Sample result is greater than 4 times the added spike

The MSD recoveries for all target PFAS compounds for sample location RFAAP-OFS2-GW-1-042022 are consistently 33 percent to 50 percent recovery. Therefore, the MSD low recoveries may be due to a spiking error. All results are qualified as estimated.

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J+
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J-
< 10%	Non-detect	UX
	Detect	J-

Control Limit	Sample Result	Qualification
SR>4X: Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Sample locations associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
RFAAP-OFS2-GW-1-042022	All target PFAS compounds

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> 30%	Non-detect	UJ
	Detect	J

7. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the DoD QSM 5.3 acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soils is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of two times the LOQ is applied for water matrices and three time the LOQ for soil matrices.

Results for field duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
RFAAP-OFS1-GW-1-042022/ RFAAP-FD-2-GW-042022	Perfluorobutanesulfonic acid	4.0	4.2	AC
	Perfluorohexanesulfonic acid	160	170	6.1%
	Perfluorobutanoic acid	4.6	5.0	AC
	Perfluoroheptanoic acid	1.8 J	1.9 J	
	Perfluorohexanoic acid	11	10	
	Perfluorooctanoic acid	4.0	4.6	
	Perfluoropentanoic acid	3.4 J	3.4 J	

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
	Perfluorooctanesulfonic acid	33	36	8.9%

Notes:
AC Acceptable

The calculated RPD and results between the parent sample and field duplicate were acceptable.

9. Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met method criteria.

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☐ Yes	☐ No	☑ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625.1/608.3 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote #

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) NA were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

SR barcode labels applied by: KDRW Date: 04/22/2022

Appendix M - SI Laboratory Analytical Results
USAEC PFAS Preliminary Assessment/Site Inspection
Radford Army Ammunition Plant, Virginia

Notes:

1. **Bolded** values indicate the result was detected greater than the limit of detection
2. Grey shaded values indicate the result was detected greater than the Office of the Secretary of Defense (OSD) risk screening levels, (OSD. 2021. Memorandum: Investigating Per- and Polyfluoroalkyl Substances within the Department of Defense Cleanup Program. September.).

Acronyms/Abbreviations:
-- = not applicable
% = percent
AOPI = Area of Potential Interest
CAS = Chemical Abstracts Service number
FD = field duplicate sample
ID = identification
N = primary sample
ng/L = nanograms per liter (parts per trillion)
PFAS = per- and polyfluoroalkyl substances

Qualifier	Description
J	The analyte was positively identified; however the associated numerical value is an estimated concentration only
J-	The result is an estimated quantity; the result may be biased low.
U	The analyte was analyzed for but the result was not detected above thelimit of quantitation (LOQ).
UJ	The analyte was analyzed for but was not detected. The reported limit of quantitation (LOQ) is approximate and may be inaccurate or imprecise.

Notes:

1. **Bolded** values indicate the result was detected greater than the limit of detection
2. All laboratory reported results in nanograms per gram (ng/g) were converted to milligrams per kilogram (mg/kg).
3. Data are compared to the 2019 Office of the Secretary of Defense (OSD) risk screening levels for the residential and commerical/industrial scenario, (OSD. 2021. Memorandum: Investigating Per- and Polyfluoroalkyl Substances within the Department of Defense Cleanup Program. September.).
4. Grey shaded values indicate the result was detected greater than or equal to the OSD risk screening level for the residential scenario. Italicized values indicate the result was detected greater than the OSD risk screening level for the industrial/commercial and residential scenario.

Acronyms/Abbreviations:
-- = not applicable/not analyzed
% = percent
AOPI = Area of Potential Interest
CAS = Chemical Abstracts Service number
FD = field duplicate sample
I/C = industrial/commercial receptor scenario
ID = identification
mg/kg = milligrams per kilogram (parts per million)
N = primary sample
PFAS = per- and polyfluoroalkyl substances
R = residential receptor scenario

Qualifier	Description
J	The analyte was positively identified; however the associated numerical value is an estimated concentration only
U	The analyte was analyzed for but the result was not detected above the limit of quantitation (LOQ).
UJ	The analyte was analyzed for but was not detected. The limit of quantitation (LOQ) is approximate and may be inaccurate or imprecise.
